Greetings, Tony!

I've always wanted to visit the Center of the Universe, so how's
about inviting us Atarians (all of us!) over for a visit! <grin>

I've always wanted to try a pint of that stout English beer, too.

<wistful, longing look on face>

<grin>

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4 months. think about it. You see those 'Make.Money.Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5.00, I spend more than that in the morning on my way to work on coffee and cigs for the day. So I sent in my money and posted. Everyone was calling it a scam, but there are SO many new users from AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began recieving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM. By the end of the fourth week, I had recieved nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own bucks. Not a big chance, I admit--but one with incredible potential, because $5 is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill, money order, or bank note inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1- Fern Suarez
Mallorca 112
Hato Rey, P.R., USA, 00917

2- Philippe
2104 De Mexico
Chomedey, Laval
Quebec, Canada
H7M 3C6

3- Natalie Jansen
Lancveldlaan 18
5671 CN Nuenen
Holland

4- Chad Collier
2785 Cold Springs Rd. #49
Placerville, CA 95667

5- Steve Boltinghouse
1009 Bird St.
Hannibal, MO 63401

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at
least 19000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can. Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off
the list.And that's only if everyone down the line makes only 250
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through
and repost this article everywhere you can think of.
The more postings you make, the more cash ends up in
your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.
So, my friend, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it. Print this out
right now so you can refer back to this article easily. Try to keep
an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

If you're really not sure or still think this can't be
for real, then don't do it. But please print this article and pass it
along to someone you know who really needs the bucks, and see
what happens.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages
with your name in the list and not sending the bucks to the people
already included, you will not get much. I know someone who did this
and only got about $150 (and that's after two months). Then he sent
the 5 bills, people added him to their lists, and in 4-5 weeks he had
over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!

> functional) and sells for less.

You said it...Photoline does not have all the features of Photoshop and you
compare it anyways..

> There are some things that PhotoLine does better than Photoslop and vice
> versa. This is inherent in software packages even packages on the same
> platform exhibit these differences...Illustrator vs. Freehand as one
> example. Live Picture vs. PhotoSlop.

Illustrator and Freehand are about equevelant Photoline is not! Like me
comparing what a speed demon Clarisworks is compared to MS Office. How ever MS
Office does more...

> PhotoLine executes, loads and filters faster.

Yea are thse equevelant?

> PhotoLine run on the same Mac9500 outperforms PhotoSlop by an impressive
> margin, this of course under OS emulation called MagiCMac which brings
> true 32 bit preemptive multitasking to the Mac. Something you won't have
> until the next millenium if Apple still exists by then.

Of course MagiCmac can't use Quicktime, OpenDoc, AppleScripts QuickDraw and
emerging Apple software technology.. Nice try..

Apple will be here longer than your business. Now that Apple is buying Be,
which will incorporate certain elements of the Be OS with System 8, this new OS
will be available by the August MacWorld..

> For me to suggest that the 68060 is architecturally better or even
> remotely close to the architecture of a PPC would be ludicrous and you
> took this out of context. The point is that a 68060 running a compact
> and efficient OS and highly optimized applications is able to outperform
> a PPC running the bloated garbage coming out for it.

The only problem with this asertion is that this soo called compact OS have far
less features and functionality that matter in the Mac market.. Nice try..
Hell System 6 if it was optimized for PPC would run rings around System 7 due
to its compactness. But System 7 is more of a modern OS with functionality..

> And we sell Macs...

Not doing a good job..)

> The comparison was between TOS running TOS applications on a 68060 and
> MacOS running MacOS applications on a Mac 9500. The time to do a
> specific task on both machines is what we are comparing here. The
> DirecT60 will blow the doors off a Mac, or any other desktop for that
> matter, on pretty much any test we can throw at it.

Are you stating that this 68060 box will blow the doors off a 200mhz 604e
box..?

How can you make that statement when there are no equevelant apps on the ST
market. Like me stating that ClarisWorks will blow the doors off MS Office..

> If there was not so much wasted resources, so much bloat and so much
> disk intensive access going on, this 9500 should outperform a 68060. No
> doubt about that. But, it doesn't because the macOS is slow, hell my
> friends Volkswagen is faster than the MacOS.

Again, you are not comparing equevelant functions and features..

> I asked you to do some benchmarks on a 20MB TIFF and whatever app you
> wanted to use and haven't heard back from you. Having a hard time
> finding a 20MB TIFF and an app that can come close to the speed I
> posted? Whenever you are ready...

How can I? Again there is no equevelancy on the ST platform. Soo benchmarks
are irrelevant..

>megs, and my setup is still cheaper than a Falcon.

Well, unless you hacked into a bank, this is quite impossible.

>apps like ClarisWorks have no equal on the ST platform..

Thank Dog. We don't need no hacks like ClarisWorks.

>Don't expect WebStar, PageMill, Claris Homepage and many other

...hacks...

>soon on the ST platform. Heck, you can't even

...hack...

>up a digital camera to the ST platform that Mac users take for granted..
>Digital camera a tool for web development...

Well, I always considered a good book on HTML and a text editor tools for
web development. I have yet to see someone trying the digicam method.

[Petey-boy asks for Atari software that doesn't have equivalents on the
Mac and gets the answer "Apex Media"]
>PLease describe what Apex media is

Perhaps you should get some more knowledge of the Atari ST/TT line, it's
hardware, OSes, applications, advantages and disadvantages before visiting
an .advocacy group. You aren't an anti-Atari advocate, you're a clown.

>You must of not been paying attention to the market. The Mac playform has a
>high share in the Midi market..

When have they hacked MIDI ports into Macs?

[Petey asks for mouse buttons]
>Quite frank, what would the second button's function be?

Under X11, the second and third button will e.g. give you different pop-up
menus. On the Atari, holding down the right button and double-clicking the
left one will start a program without topping it's window (the path is
still set to the topped window).

Thorsten

This is a really wonderful idea, as I'm just as upset to see Atari
disappear without comment or popular remembrance.

However, to put this in perspective, the general media has been more or
less ignoring Commodore's demise for 2 years now. Interestingly enough,
Dateline was the TV program of choice to bombard for Amiga users when
they wanted some coverage. Nothing came of it, though.

It's only now that a US company is buying the Amiga back from the German
company that wrenched it from Commodore's dead carcass that some
occasional coverage is popping up. Sad, but true.

What it comes down to is that when the general populace forsakes
something, it remains the responsibility of the userbase to keep the
memory alive.

I know that there are many takes on Atari, and while Atari Corp. may no longer exist, there are still many supporters of Atari products.

I grew up with Atari and still remember the "Have You Played Atari Today" jingle. I remember when I first got a Sears VCS (2600) and played it well into the night. I think I had Combat and that game where you shoot stuff that just scrolls by. I really can't remember now. One of my most favorite games of all time was Kaboom! I know it wasn't an Atari game, but it did play on my VCS!

I'm sure everybody has seen the big Atari symbol in Bladerunner. Trouble is, I wonder if the name Atari will even be around when that time comes? Is there a list of Atari appearances in movies or TV shows? It would be interesting just to know.

Anyway, Don Thomas has written two articles that I've reposted here in the hopes that people will read them. It would be nice if the name Atari were kept alive for at least a little while longer. Maybe if somebody notices, maybe if somebody remembers, just maybe...

Dom

P.S. Here is a list of e-mail address that I've compiled:

I don't know about him but personally I PREFER to use Monochrome, it
is much easier on the eye, and WTF do you need colour to do word
processing? If Monochrome is faster and you prefer it then you use it,
it's called 'making the most of what you've got' but having a Mac you
wouldn't understand the concept of maximising efficiency.

>> As far as software I would like to know an alternative to

>MacFormat from the UK..

"Only Mac", always playing catchup, we've had Pagestream for years.

>As for CAB, I am sure anything is better. But the ST platform is always paying
>catchup and not being the first with new innovation. Macs are cheap and will
>be even cheaper as the weeks go by. With all these internet related apps and
>the cheap hardware I can find hardly a case for the ST platform..

I almost agree, I would never recommend an Atari platform unless
peopel wanted to use things like Wordprocessing, Spreadsheets etc and
they had a limited budget but my system has built up over several
years as has the software that I own, I have a finely tuned plaform
that is exactly how I want it, moving platform and having the set of
apps that I currently own in native format would cost a fortune.

>You think that is exclusive on the ST? Ever hear of Macros, Quickkeys and
>Alias? I can put Alias of apps anywere I please...I can put apps in my startup
>sequence if I want..

Just incase you didn't realise you can also put apps in the ST startus
sequence and you have been able to since 1979 IIRC.

No it didn't. TOS does not have pre-emptive multitasking, you have to
buy MagiC for that, and lose some compatibility as a result.

Anyway, you have yet to explain (other than formatting floppies, ffs)
why it is so important? I believe that it is "better" rather than
"essential".

You could also look at the myriad of things missing from TOS (or even
MagiC).

Dunno about 180Mhz, but I upgraded from 040 to 100MHz PPC 601 for £300.
As someone who does a lot of raytracing, the improvement in speed over
the 040 is stunning, and compared to the 16Mhz 030 in the Falcon is
in a different league. Have you tried running POV on a Falcon?

I think the people who already own an ATARI will remember?, who else
is there to tell, who else would care bar ATARI owners? I think the
saying is "Preaching to the Converted"

>However, to put this in perspective, the general media has been more or
>less ignoring Commodore's demise for 2 years now. Interestingly enough,

Did Commodore do anymore for your average Amiga owner than ATARI did
for the average ATARI owner, ok we can thank each company for making
the respective machines, but what else?,
ATARI in effect died, but to be honest I and a lot of other ATARIans
didn't notice any difference?,

>Dateline was the TV program of choice to bombard for Amiga users when
>they wanted some coverage. Nothing came of it, though.

This will be in America will it?.....

>It's only now that a US company is buying the Amiga back from the German
>company that wrenched it from Commodore's dead carcass that some
>occasional coverage is popping up. Sad, but true.

Let us say Amiga is resurrected, then what?, what difference will it
make to the average Amiga user, If the ATARI name was bought back, and
ATARI started to trade again, I am sorry but it wouldn't mean anything
to most people, maybe nostalgically?

>What it comes down to is that when the general populace forsakes
>something, it remains the responsibility of the userbase to keep the
>memory alive.

Yes, but only Amiga users will keep Amiga alive and ATARI users will
Keep the ATARI name alive, no one else will bother, it's not a
profitable pass time:(

Theres a loayal band of Spectrum owners out there, keeping the name
alive, how many of us had Spectrums, we moved on, and in effect turned
our backs on the very machines that introduced us to the world of

Computers,

Cheers.............!ynoT

Isn't that because Sparkle does not co-operate? If so, then it's
a fault in the app, not the OS. As I said elsewhere, I would agree with
you that pre-emptive multi-tasking is better, but it's not as important
as many other things.

>Now search ftp for a Mac file called QT2MPEG.sit.hex. Unstuff it.
OK, where's the TOS equivalents of QuickTime? QuickDraw 3D? etc

If you've followed this thread from its inception, then you'll know
that the floppy issue was raised only to make a point about the
intuitiveness of the Mac OS...Like you, I haven't used the floppy
on my Falcon 030 in days, maybe even weeks...CD-ROM gets used quite
a bit though! :)

>-scott tirrell

Sorry for the post Scott. I reacted badly to all the Mac bashing that seems to be going on around here. I owned an ST and a TT and thought that they had great hardware. I have never really liked TOS but it is certainly better than Windows and, IMHO, better than the early versions of the MacOS. However, I think that it is absurd to compare an SGI to a Falcon.

So.. don't buy one! Just ignore all of us stupid Atari users who are producing music (or whatever) on our computers, while you produce an endless slew of silly emails on yours. See how easily your problem is solved?

BTW, Macs were overpriced for years, but you still evidently bought one. Why did you buy one over a PC? Probably because YOU LIKED IT!!!

Computers are TOOLS! It's not a religion!! Buy what you want to buy, whatever you will use, and shut up already with your incessant childish whining about what computer is better. THE ONE YOU ARE PRODUCTIVE ON IS BETTER!!! Grow up and get a life.

It's a beautiful world out there, Mr. Sinclair-Day..

How can anyone take you seriously? You are incredibly ignorant about
what
people actually USE the 1040ST for. The computer is used by
platinum-record
selling artists, particularly in Europe. Erasure has said they will not
use a computer other than Atari because the timing on the MIDI ports of
both Mac and PC is always off, ever so slightly, because of the way the
OS is written and the MIDI info comes over the serial or parallel
ports.

How can you criticize something you know so little about?

-Mark

I am selling the following Atari Computer Equipment and Software:

several 520
2-1040 STF
2 or 3-SC 1224 colour monitor
240 Meg Hard Drive
120 Meg Hard Drive
several key boards
Lots of parts
Power Supplys, Hard Drives and case
Atari 1050 Disk Drives w/ US Double

Various Joysticks, controllers, Power Supplies and Cables

Approximately 500 disks full of software, all double sided

A lots of originals progs. and lots of disks and instructions
Mouse, Joysticks, PC ditto II card

All for only $???

Brian,
You are normally very thoughtful in your responses
so it surprised me to see that you think Atari
hardware "sucks." Do you not think, for the
time, STs, TTs and the Falcon were great home
computers? The Lynx and Jaguar were also
impressive hardware. I personally think that
my Macintosh 6214 which frequently crashes
and is a replacement for the first one I had
because it would not work sucks. Now that
Apple is trying to cut costs we are seeing
the same problems Atari had with quality
control.

I can believe it! They are excellent in terms of support and
approachability.

Looks like another excellent year of new software milestones for
the Falcon.

Mr. Sinclair is in my opinion, looking for and enjoying the attention.
He must be very insecure with his Mac purchase.

All the best,
Chris A Computer Direct

You said I can't experience the thrill of a BMW, and I pointed out that I can.

I don't need a Mac to do this, and although the technology that you are
talking about does not exist on Atari computers, this doesn't mean it
couldn't. Nobody has seen a need to write the software to play these
cheap simulations.

I take exception to your post claiming I am a nerd who hawk hacks
hardware / software platform. We are a very highly respected business
known for our innovative design and customer service both in the Atari
and the Mac market.

Our systems sell worldwide, they are bought by end users that are not
afraid to be different to be better.

Well, they do pretty much, yes. It can't be forced by Apple, but
the guidelines are there and most authors stick to them. Every Mac
program I have ever used has the same keys for cut/paste, for example,
but in the few Atari programs I still use some have different combinations.

> [Re: AtariWorks]
>Besides that, its free...
As it happens it wasn't free (bundled with Falcons) in the UK.

> would I have to pay for a comparable Mac program?
Claris Works is far superior. v2, which is marginally better than Atari Works
came with my machine, the upgrade to v4 was pretty cheap (can't remember
exactly, something like 50 quid, which is what I paid for Atari Works).

It's a shame that Soft Logik are so incompetent, as PageStream would
make a useful addition to the Mac's software base if priced right; it's
the easiest to use DTP package I've seen. Unfortunately, it was always
buggy and slow. From your comments, it appears they've made it even
worse.

>In fact, Pagestream on a TT is faster than Pagestream on a 9500.
They didn't do v3 for the Atari platform at all, though, unfortunately.

: PLease describe what Apex media is and no doubt a higher eqivelant is
: available..

APEX media is an animation and graphics package for the Falcon030. It is tremendously powerful and has features that make many other graphics/anim packages for PC/Mac look very sad in comparison. Most of all it has speed, thanks to extensive use of the Falcon's RISC based DSP chip. Many functions work in realtime. I don't think I have really seen ANY Mac/PC graphics packages that come close overall. Some have more features, but NONE can offer speed and intuitiveness the way this program does. So there really isn't an equivalent Mac package!

: So TOS must of been ported to PPC...About time... Has only been close to three
: years that the PowerMacs have been out..

With the kind of speed the 68060 Atari clones run at, I think that PPC based clones will simply honk! :)

: > I would still like to know if Mr. Sinclair-Day has actually used a Falcon
: > before, and how it was setup...maybe someone should show him one day and
: > make him eat all those words from over all those years...
:
: Not much there, when the slowest 030 mhz is used..

Didn't think so!! Maybe our esteemed 'friend' had better find a Falcon owner who has APEX and some other DSP based stuff. I'm sure Mr.Sinclair-Day will go pretty quiet for a while after that...

Are you suggesting then that MS Office is a better package than ClarisWorks? Is it in your capability to do so? Your line of reasoning here is pretty even but it goes steadily downhill throughout the post.

> > PhotoLine executes, loads and filters faster.
> Yea are thse equevelant?

Yes, of course they are. People use similar packages all the time to perform functions which one can do better than the other. I sometimes use MS Internet Explorer over Netscape Navigator because I like the efficiency and friendliness, and sometime use Netscape because I like the control and the range of plugins. The word processor Marcel on the ST has some good functions which Protext hasn't, but if I want a document printed in about 2 seconds, I use Protext.

Once again, you are assuming that one is better than the other just because it is. Some people prefer a basic CLI, others want a whizz-bang GUI.

I didn't compare a Falcon to an SGI machine, I just said that the
reasons are similar ie they are great at what they are made for and do
so with class eg Audio Recording on the Falcon and high resolution
graphics on the SGI.

As an aside I just recieved a brochure of Apple stuff (I ordered some
Zip disks from them so they think I've got a Mac I guess) and was
looking at Mac prices. I understand that a 603 isn't as 'good' as a 601
chip but how does something like a 6400/200 compare to a 8200/120, in
real use? I am genuinely interested.

People spend big dollars on [insert-brand-name-here] computers because:

1) It does its intended job better than the opposition

How well a machine does the task should be thought about first. Goodness
of hardware means nothing - a machine with really good hardware may get
the job done worse than a lesser machine.

2) In some cases : Phallus size is linked to purchase price

: the easiest to use DTP package I've seen. Unfortunately, it was always
: buggy and slow. From your comments, it appears they've made it even
: worse.

I use Pagestream all the time for DTP (my own business and hospital forms for a local hospital). Except for the problems with color information when pasting between documents (must paste between pages, then save out as a new document), the problem with using the "white" fill when shooting to Linotronic (use solid and change color to white) and the need for a fair mount of memory (all DTP needs memory - except for Postscript output), the Atari version of Pagestream is VERY stable and bug free.

Much of the code (I have been told) was optimized 68000 assembly as the author was skilled in Motorola 68000. Pagestream (for its complexity) is very fast! The few problems (they are all well documented and have simple work arounds) are negligible. The combination use of text as text fonts and also as objects (with all attributes) make Pagestream a superb program. I have used it for years for 1270 and 2540 lino output and have had great success. It really shines on a TT. It is disheartening that Soft-Logik dropped support. What a great program!

Hi there!

People have stated in this thread that NVDI is a hack. That is ludicrous! I compare NVDI to Adobe Type Manager for Windows (or Mac?). That would seem to be one of the main purposes of NVDI. If you deleted ATM on PC (or Mac?) you would have a boring system with no font support (similar to TOS without GDOS).

But then remember that NVDI also accelerates video (nicely too!) and provides fixes for some of the small anomalies in GEM/TOS.

Just watch how nicely video updates on Ataris with NVDI, and then compare that against Macs such as LC3. The Mac interface NEVER seems to run as smoothly even on a perfectly useable Mac like an LC3...

And your winner by a WIDE margin....NVDI!!

Just confirms that the ST color video sucks.. Whats this making most of what you've got? Sounds like you are stating that you can't afford color considering that the ST hardware is sooo expensive..

All I know, I maximised efficiency for what I paid for my setup. I suppose ST users are use to pay more for less..

> "Only Mac", always playing catchup, we've had Pagestream for years.

Ha ha ha.. Remember desktop publishing was invented on the Mac with Pagemaker..

Lets hope Pagestream isn't buggy as the Amiga one was..

Look for an old movie called "Cloak & Dagger", it was based on an
Atari game. The show is full of store racks dripping with Atari
cartridges, as well as a computer guru using an Atari 800 (State of
the art... I said OLD movie...)

:)

> You have an Alias for every progam? Thats OK if you only have a few I
> suppose...

I use alias on the most used apps. I have alias in the Apple menu, launcher and in the HD folders..

> You quite obviously have no idea what these are, MagiC for example is
> no more a hack than MacOS.

Of course you would state that..An extra cost to add functionality to an overtly overpriced hardware.. Why is this an expensive platform?

> What is more exactly, and don't start the Quicktime arse again, thats
> an *APPLICATION* it may come with the OS but it isn't a part of it.

Quicktime is an extension of the OS... Quicktime does not run under Tos, a disadvantage..

> You think people really care? I've told you already, a set of macros
> is far more configurable and cheaper.

How would you know? Have you ever used the tools that I listed? Can't compare macros to the apps I listed.. What denial..

> Again I've told you, there is a thing called Photo CD, it has no
> startup costs and the photo's are of an infinitely better quality, pay
> $500 to put a few photos on your web page did you? Sucker!

Yes, but you have the option to add such a camera, but not on the ST.. Photo CD has been on the Mac for years and now it shows up on the ST....Not invented syndrome is prevalant.. Having a digital camera has other uses besides for web pages.. And no I did not pay one cent for one. I borrowed one..

The technology in digital cameras has been improved vastly, something you would not know and have not been folloeing..Typical denier..

>>> APEX media for 100UK Pounds. Gimme a Mac app that even comes close for
>>> similar $ and I'll tear my head off and feed it to myself. Other examples
>>> exist like Photoline, DA`s software, Steinberg software, and much more.
>>> All these apps provide as much if not more features than similarly priced

I recently installed Gbell on my STe. A limited list of AES
calls were given in the docs, but I want sound samples when
I am asked to confirm whether I want to copy/move/delete files,
among other things.

Does anyone have a fuller listing of AES call numbers and their
meanings?

Thanks in advance,

The hardware today sucks compared to what you can get for less money on the other platforms..

I too have a 6214 and have been fortunate not to have problems as you stated. The 6214 is a bargain when I got it for $895 new with a gig HD space, keyboard tons of software.. Apple has extended the warranty to seven years..

The 6200 line was concieved during the Spindler regime when Apple dropped the ball on quality. However, under Amelio the hardware quality is about rock solid. The 6400 is solid as well as the new PB1400..

>but in the few Atari programs I still use some have different combinations.

Right. Most but not all. Some but most do...Ah, the language here, my
friend... :)

>As it happens it wasn't free (bundled with Falcons) in the UK.

Hmm...so you're saying that Falcon owners in the UK had to buy
Atariworks separate from their Falcons? I didn't know that...I
have seen where some dealers sold the Falcons without the soft-
ware because it was unavailable at the time but they "rainchecked"
i.e., sent it to them as soon as it did become available...

(of course, we are talking about hard drive equipped models here)

>Claris Works is far superior. v2, which is marginally better than Atari Works
>came with my machine, the upgrade to v4 was pretty cheap (can't remember
>exactly, something like 50 quid, which is what I paid for Atari Works).

So I would have to buy a Mac to run this program...thanks, but no thanks.
I've said this to Mr. Sinclair but it didn't sink in...(no surprize there!)
Atariworks does just about everything I need, its rock-solid, it runs on
my Falcon (big strike against Claris Works there!) and it was -FREE- with
my Falcon purchased here in the US...along with a lot of other great soft-
ware bundled with the Falcon...(AFM, SAM, Falcon D2D, etc...) Software that
I just can't get on a Mac...(wouldn't want to anyways) So there it is, you
like Claris Works on your Mac and I like Atariworks on my Falcon...I'm
sincerely happy that you're comfortable with your choice of platform. Well,
I'm very comfortable with my choice of platform, so please don't insult
me (and the rest of us) by trying to convince us that we made a "bad"
choice...we didn't, friend... :)

Sputter...Must of been soo emotional when you wrote this..Lets discuss the
facts here..

Apple is incorporating certain components of the Be OS into Mac OS8 to get it
to the market by August's MacWorld..

Apple is not abandoning the current OS.. Apple will be releasing major updates
twice a year of System 7.. For the next few years there will be two OS's..

The only thing TOS has had since '93' is a barrel down irrelevance..

> The Apple abandonment of MacOS in favor of BeOS is the perfect

It's not my intention to insult, I assure you. Unlike Petey-boy,
I was an Atarian until recently, having had an ST, then an STe, then
a Falcon. So I'm not relying on the sort of guesswork that he is.

All that's happened is that I moved onto a Mac, and found myself
thinking "this is so much better, why didn't I move before?".

Your positioning of the Falcon as a great audio machine is a little suspect,
though, given the very poor quality of the converters for example. Once
you start buying quality external ADC and DAC, you're starting to get
up towards the same sort of investment as people using other platforms.

Chris, Mr. Peter Sinclair-Day has no clue about how to run an
entrepreneurial venture.
```

For one thing, your business is a leading provider of TOS solutions and systems.

For a second thing, it is helping to grow the market.

A quick thought - if the Mac market is exploding so, and the Mac clone market is doing so well, and Petey is so smart, why doesn't Petey start his own clone firm and make millions, swamping Computer Direct TOS machines?

Because it isn't at the rate he wants you to think, it isn't at all, and he isn't.

Keep up the good work.

BR Miller
Boston, MA

Thank you for a well reasoned reply at least...(unlike a certain person's
semi-moronic ramblings!

I've only used one Mac...a Quadra that we have at work...its okay, and
its certainly friendlier than the Wintel machines...but I still prefer
my Falcon... :)

>Your positioning of the Falcon as a great audio machine is a little suspect,
>though, given the very poor quality of the converters for example. Once

So many professionals use Atari's for studio work that I can't help but
believe that what they say is true! :)

We have the Mac Quadra at work, and a Pentium with Win '95 on it...I've
played with both, but I simply cannot do what I do on my Falcon as quickly
or easily...you can get there, (eventually) but with a lot more effort.

Nah, the ZDNet article just gave me Atari Flashbacks.
This manuver is worthy of the Tramiels.

>
> Apple is incorporating certain components of the Be OS into Mac OS8 to get it
> to the market by August's MacWorld..

They are going to create new hardware and new software that will be
incompatible with old Mac software (MacWeek). This is quite a bit
different than what you would have us believe. Apparently, Apple
was not up to the challenge of producing Copeland. So, they choose
to
cannibalize another OS in one last desperate ploy.

>
> Apple is not abandoning the current OS.. Apple will be releasing major updates
> twice a year of System 7.. For the next few years there will be two OS's..

...one of which wont be able to run the old GUI apps. This is a
feat
that Magic mangages as does NT. There will come to be a situation
where
PCs, Suns & HPs will be more compatible with Mac software than
Apple's
own, new, mutley platform/OS.

Apple will produce yet another completely incompatible platform
when it is
not at all necessary or even productive. Apple will give consumers
in
general and even older Apple users good cause to avoid the new
BeMacs like
the plague. We now know why MAE never made it to the x86
platforms...

[deletia]

Actually, I was using a phone. You were too busy foaming at the
mouth
to pay attention to what I was saying. Their phone system doesn't
even
measure up. Yet they expect anyone too take the rest of their
tech.
seriously enough to buy it.

The information that I was interested in was not there to be had
anywhere.
Even CyberMongrel can't read what is not there. Although, the
comparison
I was making was between Linux and MacOS anyways. So, much for
superior
MacOS Web authoring tools...

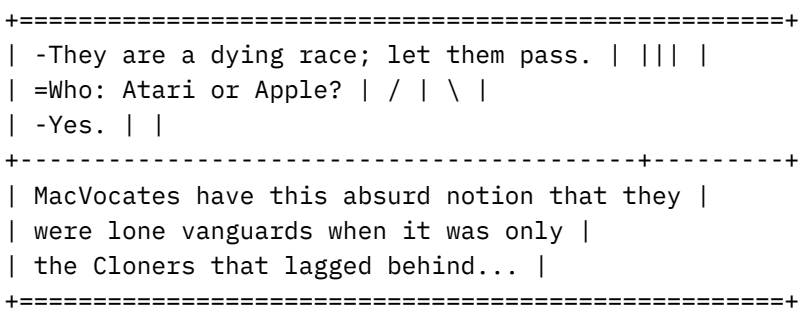
I tried several times. The reference you gave was unusable.

>
> > You are!
> >
> > These blunderous references are downright... atarian!
>
> ROFL!! In what way?

They encourage customers to go to competitors.
Someone might conclude from this general lack of Mac vendor
incompetence that the Mac itself is also incompetently put
together.

Or, in the very least, they would be worried about this platform
lasting very much longer.



-They are a dying race; let them pass.
=Who: Atari or Apple?
-Yes.
MacVocates have this absurd notion that they were lone vanguards when it was only the Cloners that lagged behind...

Here is an update with some more e-mail addresses if you care:

http://www.cnet.com CNET Central

richard@cnet.com Richard Hart
gina@cnet.com Gina St. John
crisis@cnet.com Desmond Crisis
dvorak@cnet.com John C. Dvorak
hari@cnet.com Hari Sreenivasan

letters@newsweek.com Newsweek Magazine

http://www.webcrawler.com to find more e-mail addresses and web sites.

I hope that with some luck Atari will get the exposure it deserves.

I know that many of you think that this effort is "preaching to the choir", but you must remember that many people out there who actually remember the days of "Pong" or the "Atari 2600". Just because they think that Atari went out of business years ago, doesn't mean that they wouldn't sit up if they heard a story about Atari. Now I am not suggesting that it will bring Atari back to life or something, but wouldn't it be nice to know that the company we "love to hate" got at least SOME respect?

Thanks!

Dom

> Does anyone have a fuller listing of AES call numbers and their
> meanings?

A list of AES calls for these tasks would not help because:

a) If you're using the built-in desktop, it doesn't use normal methods
for making AES calls, and there is no way to intercept what it does do in
later versions of TOS.

b) Even if you are using a replacement desktop, there's no way for GBell
to tell the difference between any one dialog and another. There are AES
calls for displaying dialogs, but there is no call which says "display a
confirm copying dialog" specifically.

Pete doesn't mention the fact that if it were not for Apple's sloppy
code, companies like Connectix would not program "Hacks" to the MacOS.

RAM Doubler to replace Apple's sluggish Virtual Memory.

Speed Doubler for Apple's inept disk access.

Speed Copy to bring functionality to the copy function.

Speed Doubler for Apple's even more inept 68K emulation on PPC.

Gee, does it surprise you that more copies of *.Doubler have been
sold than PowerMacs?

Get your facts straight! You can hook up a Digital camera to an ST.

>You tell me since you are claiming to be an expert..As I stated previous on
>Photoline and Steinberg.

Photoline is an equivalent app. It is faster. It lacks layers, for now,
but it has features that Photoline does not have.

When are you going to load a 20Mb TIFF into ANY image editing package
you can find for the Mac, go ahead, pick the fastest one. None will
come close to the speed I posted.

After you are done that, we will do some filter times.

Put up or shut up.

Steinberg has upgraded CAF three times this year. The last upgrade
included support for recording 8 distinct tracks of audio simultaneously.

Not on a Mac, or PowerMac.

I would like to see PPC native apps using an antiquated 060...

Pentium cards cost $1500? Must be fully loaded.. Apple's Cyrix card is below
$800 and their Pentium cards is under $1000.. Huge difference..

> real use? I am genuinely interested.

The 603e has replaced the 603 and blows away the 601. The 6400/200 just destroys the 8200/120. Why is it that Apple still offers a 601 based 8200 which is not available in this side of the Atlantic. Hate to ask how much a 8200 is? Probably the same as a 8500...Only Apple...

Well, in Germany, it certainly did, and it's still available. Bad thing
is, Atari/JTS "sits on the rights" since they bought this neat little
machine. BTW, I've seen a JTS hdd last week.

>Maybe.. but if you do, why do you spend so much time posting anti Atari
>flames?

Because Petey-boy made the "right choice" again and again - he doesn't try
to convince _us_ of that, he tries convincing _himself_. This behaviour is
pretty similar to that of some Atari fanatics and especially found among
Amiga kiddies: they feel insecure and envy those who have made the cur-
rently right choice (Pentium w/W95), so they try suggesting themselves
that _they_ were right and all the others were wrong when they bought
their computers (no matter whether these don't want a Mac, they have to
admit to Petey-boy that he was right when he did). Good old Sigmund Freud
would also suspect Petey-boy's got a very little pecker, resulting in low
self-confidence.

>I don't get it. Maybe you'd be better off using your beloved
>Mac to actually ACCOMPLISH something..

Nhah, who would ever have a computer just to _use_ it?

There is no such thing as "little converter quality" on C-Lab Falcons.

>Once
>you start buying quality external ADC and DAC, you're starting to get
>up towards the same sort of investment as people using other platforms.

Not quite, for the MIDI/music use the Falcon is still quite competitive
(otherwise C-Lab would have dropped it meanwhile), it's just that an F030
that can be bought (used) for 500-600 DM (300-400 US$) can't compete with a
5000 DM (3300 US$) PowerMac 7500, and it was never meant to.

Note that I am not accepting Petey-boy's prices, for Macs are not at all
cheap in Germany, and because of that (and the crappy MacOS) I'd prefer
going for a Linux Pentium or even a BeBox instead.

C-NET can be found on the Web at WWW.C-net.com.
Also if you have the USA channel(which also owns Sci-FI)
You can watch C-net at 5am (central time) on that channel.
dan
(2.50 for one channel or do you get 5 other channels with the sci-fi,
I have Time Warner cable they give us the sci-fi channel,cartoon network
history channel,Plex (formly encore +) and Flix for 1.99 a month (unfortaly
we have to use their cable box to get those channels and we only have one
box and it's in my room)

I'm not really sure what sort of camera you are talking about but if
you mean those video conferencing style things then you've been able
to use a digitiser like VIDI ST/Videomaster along with a video camera
since the dawn of time. Normal digital cameras have very poor

resolutions (or at least the affordable ones do) so I use PhotoCD
thanks.

>> Again I've told you before, there is no reasoning to your upgrade

There is a limit to how far you can take a product, if it isn't broken
then don't fix it. There is no point in just adding features that
virtually nobody will ever use just for the sake of it.

>>>So TOS must of been ported to PPC...About time... Has only been close to three

The game was based off the Movie, not the other way around.

Also, 'Cloak and dagger' is being made into a new Television series. I am not sure with network tough. I think it will be out next season (or as a mid-season replacement this season). FYI

Fess up, Stan III. You are back up to your old forged-cancel tricks in an attempt to muzzle the meow meow community. You might as well save your
time and effort. With Fluffy the Cat on our side, we are INVINCIBLE!

> the most important thing in all of this is actually not
> to killfile mlb61@bu.edu--because this isn't an article from this
> address--it's a forged troll that is an attempt to get this person
> killfiled--don't do so)

Shit, even Matt's own little sister told him to keep his ass off of Usenet and to lay off the meowers. If only he had listened. Meanwhile, you're just trying to deflect the fact that Francois caught you red-handed forging cancels again.

> [Followups to this article should be made to news.admin.censorship and
> news.admin.net-abuse.misc]

And also to any other newsgroups you consider appropriate. Please feel free to add to the list! ;)

> [Forged article follows]

Pot-kettle-black served up as third-rate performance art, Stan?

Not to worry. Matthew Bruce, the real Matthew, has authorized me to cancel
any and all articles _anywhere_, that claim to be from him. And I'm
doing so.

The real Matt Bruce isn't posting anything, so killfile if you wish to
avoid the forged junk.

If you have the capability of killfiling on "Austria.EU.net" being
in the Path line, you will want to do that.

Yet another open NNTP port.

We already dismissed the use of the rest as trivial and
unproductive (even for their stated goal). The only genuinely
non-advertising uses he managed to come up with will be
suited by Mpegs, Avis or Seqs equally as well.

It's much like harking about one of the Office Suites.
They do almost everything except wash your dishes but,
most users don't require such functionality. Much of the
package sits there wasting space on your hardrive and
does nothing except give the producer bragging rights
to irrelevancies in advertising.

Hamilton was a wonderful troll from August a year ago. It should have
been allowed to fade gracefully, but, then, the "me too!" crowd picked
it up.

:
: Not their fault, you were using CAB.. Next time use a real browser not that
: certain 8 bit hackk..)

The only 8-bit browser I know is The Wave for the C128, and that's not
even released yet. AFAIK, CAB is W3-compliant, so the fault must be at
the vendor's end.

Bad luck Pete, you just went for a sentence begining with "whatever",
ever time you do this it is quite obvious that you know nothing about
what you are talking about, you admit you haven't seen APEX and yet
you are 'sure' that he is talking out of his ass!!! And unsurprisingly
you don't mention any specific apps, odd that.

Grow up, obsolete they are not. A PPC is not a DSP.

>destroys the 8200/120. Why is it that Apple still offers a 601 based 8200
>which is not available in this side of the Atlantic. Hate to ask how much a
>8200 is? Probably the same as a 8500...Only Apple...

An 8200/120 16meg, 2Gig, 8xCD costs 1269 UKP, a 6400/180 16meg, 2.4Gig,
8xCD with 28.8 Modem, surround sound and 3 more expansion slots, and you
sy the latter is by far the better machine although it costs 1249 UKP!
The only drawbacks that I can see on the 6400 is no Thin Wire/10 Base
ethernet support, so is there genuinely no other drawbacks on the
Performa because the sounds quite incredibly weird to me esp as the
Performa range comes with lots of apps and the TV/Video stuff too. So
what's the deal, is this just weird or am I missing something? Does
the performa have PCI slots? What sort of performance difference is
there between the 601 and the 603e, what sort of speed 603e would
compare to say a 120mhz 601?

Another thing cats (aka meow-meows) do!!! the list now includes:
1) meow
2) poop
3) scrath up curtains and furniture
4) take up too much space

add your own here!!!!!

No way, not this time Petey. This is where you are absolutely wrong.
I've tried the rest, Apex is the best.
>

Who cares about price? I sure don't. Price is for people like you
that settle for a sub-standard PPC from Apple because if "fit
your budget" (more like your mommies budget).

>
> > : Not much there, when the slowest 030 mhz is used..

Yea, that is why Radius sells Photoshop accelerators that utilize two
DSP's just to speed up the filter processing. They can bypass all
the slow Mac O/S calls and use simple DSP code while your RISC processor
chokes on the millions of bits of usless crap it has to process.
Nice try...

Read the whole sentence. Just like the Pentium CARDS, meaning a RISC
processor in the PCI slot.

>
> Pentium cards cost $1500? Must be fully loaded.. Apple's Cyrix card is below

> there between the 601 and the 603e, what sort of speed 603e would
> compare to say a 120mhz 601?

I am not sure how the 8200 fits now that the 6400 is here. The 8200 is the same as the 8100/120 which has been discontinued for some time and is based on the Nubus archetecture not PCI. The 6400 has two PCI slots, comm slot, TV tuner slot and video slot.

The 601's top speed is 120mhz while the 603e is currently as high as 240 mhz. The 603e completely destroys the 601. Apple will most likely be phasing out the last 601 machines which is the 7200/120 in NA and possibly the 8200 in the UK.

The 603e processor mhz speeds is equivelant to the same speed on the Pentiums. The Pentium maxes out at 200mhz while the 603e's fastest to date is 240mhz. 300mhz is soon, reportedly in the first quarter/97. Intel is having difficulty in rasing the mhz above 200 for the Pentium Pro..

The 6400 is a better buy over the 8200 due to extras as standard such as integrated subwoofer, 28k modem, keyboard, 8X CD and software bundle..

I'm afraid there are no AES calls for copy/move/delete... the
AES is for primitives, like drag, click, select menu, open window
etc.

>Does anyone have a fuller listing of AES call numbers and their
>meanings?

Check out the Atari Compendium for a full list...

Yea, I know what he is talking about. I have a Reply Dos on Mac card
that
a couple of years ago cost $750.00 for a Cyrex 486/66 on the card. I
though
somewhere we were talking about Pentium 133mhz cards. I see in Mac World
Mac Storm has 100mhz cards for $975.00. But a 100mhz is less expensive
than
a 133 which i'm sure puts it over a grand.

You probably wouldn't dismiss text tracks if you were deaf or blind. You probably wouldn't dismiss VR if you were into multimedia design or interior visualization. You wouldn't dismiss 3D support if you wanted to export 3D models that cannot be easily encoded using VRML. BTW VRML is being augmented to support Quickdraw3D geometries so that might become a moot point soon.

>Just more of your bull shit.

They actually do cost about that much. However, Petey-Boy is leaving
out some VERY important details. To begin with: they are all rather
low end by current standards. Also, Cyrix continues to earn a bad
reputation. The aformentioned $800 is essentially a souped up 486
clone. REAL motherboards (w/ that CPU) go for approx. $100. That
Pentium board is rather skanky too. They don't sell packaged systems
that slow anymore (100Mhz). You'd have to go to a cottage hacker
shop to find such low end hardware on a PC these days. These are the
kind of stores that MacVocates typically like to sneer at. BTW, a
whole Pentium 100 system can be had for $1100 these days. Mac Lusers
are getting charged $1100 for a $300 piece of hardware (real value).

You can get a P6/200 & ASUS MB for less than any of these
'Mac Bargains'.

Sure they're cheap by Apple standards. That 'standard' should warn
anyone away.

>Grow up, obsolete they are not. A PPC is not a DSP.

It is true that the PPC chips are not DSPs but they do have some of the features that one expects in a DSP. We could probably come up with some play examples to see whether a PPC chip or the DSP/68030 performs certain DSPish functions fastest. Personally I would bet that the PPC would come out ahead. A 604e can complete 2 floating-point multiply and add (FMULADD) with 64-bit precision in 5 cycles. It can simultaneosly execute simpler instructions (up to 10 can complete in five cycles) as well.

Hello, I am currently looking for an Atari 5200, game system. I am a collector and am looking for the system as well as any games for it. You can email me at eman9@msn.com or simply reply to this post.

I am looking forward to hearing from anyone who has the system and will offer a decent price for one in good condition.

Thank you

Why?

You can play FLI/FLC/FLH/SEQ/AVI/MOV/FLM/DL movies from one program.
Can you do that on the MAC?

If he gets too desperate for a particular file format, he could
] just run Linux. Or, he could just port the relevant code.
Availability of the Atari GNU C compilier should make that task
relatively easy.

Are you being deliberately dim? The problem isn't that there hasn't been
a few people who agreed on something, but that people in the Atari
world haven't stuck to "standards", either de facto or universally agreed.

I have plenty of apps released after 1989 that don't conform to your
standards.

I think that these are discontinued here too, it's just stock
clearance from what I can see. The point is though, what is the main
difference between a Performa and a Powermac? I have heared there is a
6400 Powermac and a Performa, I assume that the PowerMac version is
more expensive and yet only appears to have the ethernet extra, what
gives?

Here in the states, the PowerMac 7600/132 is now $2299. Amazing Apple still sells the 7500 in Germany. No wonder their German unit is by far their weakest subsidiary because their stuck with yesterday's technology.

Used Powermacs can be had for $500.

> Note that I am not accepting Petey-boy's prices, for Macs are not at all

No, no no no no.....A digital camera looks like a regular camera. The only difference is that the pictures from the digital camera are downloaded to the Mac through a serial cable hookup usualy through the printer or modem port..

The digital cameras are increasing in resolution quality at the same level pricing as the previous. This will be the case with the upcomming Quicktake 200 camera.

What an excuse. There will aways need to be an upgrade to remain competitve and iron out bugs..

> Bad luck mate, keep looking.

Can you point me in the right dirrection?

So you tried the rest extensively? Which ones were they?
With that kind of time on your hands, you should sell your findings to the PC
rags..

> Who cares about price? I sure don't. Price is for people like you
> that settle for a sub-standard PPC from Apple because if "fit
> your budget" (more like your mommies budget).

Oh what a change from the 80's were Atari ST advocates were rubbing it to the
Mac people that their platform was over priced..Mac Jihads pointed out that the
Mac was better due to high res color, superior system software and apps to boot
too plus appropriate R&D funding and don't forget marketing an alien concept
within Atari. Now today, Apple can do all this today still with lower prices..
Competition was the key though.

>> > Didn't think so!! Maybe our esteemed 'friend' had better find a Falcon
>> > owner who has APEX and some other DSP based stuff. I'm sure

ROFL.. Nice try. The issue is that current PPC kick but over any 030 with moto
DSP processors. Even the developers state that..

As usual Jedi-Girl has got it all wrong. All I did was correct the prices to one that seemed confused. In no way did I defend Apple's offerings. I agree, Apple's PC cards are pricey. I did install a Pentium card at work the other day with ease.. Does work. I give Apple credit were credit is due, true plug n play despite the price..

Whats cheap? I don't think those PC cards are cheap. Knock off $300 more likely..

A half-truth can sometimes be WORSE than a like. It is true that the
prices quoted were correct. I corroborated that. I could also give
a vendor on the web that has those prices NOW. However, your total
unwillingness to back up what you blather is not the issue here.

However, there are some very important other details that while not
refuting your prices do the same to discredit them as a refutation
would.

>Apple's PC cards are pricey. I did install a Pentium card at work the other
>day with ease.. Does work. I give Apple credit were credit is due, true plug n
>play despite the price..

They still charged you as much for a puny little card w/ a cpu on it
as the entire equivalent system would have cost you. You just have a
high tolerance for Mac abuse.

$300 + <plug & play> != $1200...

>
>> You can get a P6/200 & ASUS MB for less than any of these

Actually for newsreading, the ST would be fine, but we haven't sold them for years. No, I am determined to find a use for this Mac on my desk. Something easy on it, something it can handle without crashing.

Something it can do when I am not demoing MagiCMac and Atari software to Mac users that come into our shop.

Petey-boy, as soon as you start showing that you don't even know about the
Mac's weak points, Chris was wrong about the name (it's "Copy Doubler"),
but _with_ the "Copy Doubler" software, the Mac's disk operations are
about as "fast" as the original GEM desktop file operations (without
Kobold, MinixFS or the like).

BTW: Apple has just lowered the German prices for all PowerMacs: the cost
DM 1,000.-- less now (tells you about Apple's price policy here, they had
no problem asking 1,000.-- DMs more until the clone Macs came to Germany).

And before you ask: 1,000,-- DMs are 666.67 US$.

Thorsten

In the U.S. the difference between the PowerMac 6400 and the Performa 6400 is:
That the PowerMac version is only available in the k12 and higher ed market.
The Powermac version is decontented which means instead of a modem, an ethernet
is included and has no software bundle. The Performa includes a 28k modem and
software bundle. The internals are the same...

Yeah, but why doesn't apple just fix it? I mean, they are still
developing the OS aren't they?

>> Speed Doubler for Apple's inept disk access.
>
>You mean floppy disk that is rarely used..Only Atari..

Speed Doubler also accelerates hard disk access and the result is a
noticeable increase in OS performance.

>> Speed Copy to bring functionality to the copy function.
>
>If you say so..

I say so, BTW so does Connectix...right on the back of the box....

Quote "Improved Finder Functions on All Macs" "Copy and delete files
without delay. SpeedDoubler is faster than the finder, works in the
background and supports multiple copies simultaneously"

>> Speed Doubler for Apple's even more inept 68K emulation on PPC.
>
>True..
>
>> Gee, does it surprise you that more copies of *.Doubler have been
>> sold than PowerMacs?
>
>Cool..Keeps the developer in business..

Oh, I see. So for the Mac, Apple's inability to put full functionality
into the OS is cool cuz it keeps the third party programmers in
business,
yet for Atari, it is a "Hack and Slash"?

Grow up.

>
>One issue..Where do I get a Hades to compare?

Not an issue, all I want you to do is pick the fastest Mac app that
loads TIFF's and tell me what it is, do a load at your end, time it
and post it. I will do the same here, well actually I already have.

I would like to know the app you use, so that we can do the same
operation here and compare the features to those found in
PhotoLine.

>> After you are done that, we will do some filter times.

Apple's "Fire Sales" over the last year are more to do with bulging warehouses and slow sales than competition from clone makers.

At least this is what the Mac mags have been writing for the last year.

All the best,
Chris

Did you notice how Windows apps ran faster with the DOS card in the Mac
than actual Mac applications do under the Mac O/S?

Yea, just like the Mac Clone users have to pay. The Clone
manufactures have to pay to use the Mac O/S on their machines
which the user ends up paying for in the price of the machine.

Same thing.
>

> No market. Available on the other platforms..

Thank God! Of all the Mac apps i've used, and i've used a few,
DeBabbleizer is about the only one I would like to see ported to
TOS. Graphic Converter is pretty nice, and being shareware, it
blows away most commercial Apple apps.
So much for the Mac market. It's dying a slow death.
One can only hope with all the programmers jumping to Win apps
that the boat will capsize :).

The resolution is still shit. It's just a novility for those who can
afford
one. The quality digital cameras still are over $10K. And you forget you
can not mention quality and low cost when you are refering to Apple for
anything. If you want REAL quality, have your slides put on a CD. That
is
how the professionals do it. School kids can still dabble in their
finger
paint I guess.

Because Apple made them, and people still use them.
Just like ST's. Each platform has a dark history,
it just seems that Apples is a little darker than
Ataris, thus the compairson.

Hello !

I have recieved three registrations for the old versions
of MG-FTP.
From two people I have got the address, but there is one
missing.

So if the one who had registered remember the fee he had
given me and the way he gave the money, please write
an EMail with your address, because else I cannot give
you the key for the next version !!

So long,
Michael Guse

Probably out before it's time like all Atari products. HP came out with palmtop PC's which sell between $200-$300 I think, and they are basically the same type of machines as the Portfolio but smaller. They even had articles about it (portible computing) in the old Current Notes issues. I rather that than to lug some stupid ol' laptop :)

I think JTS is licensing Atari technology to companies that can make use of it. I know they do this with older games like Tempest.

[Now we get the the thought provoking statement.]

> I thought the Newton is a neat little machine?

Question mark meaning you're not sure...

Well as Tom Servo would say, "Woopie-$%^&!" :)

Actually the HP Palmtop supports VGA graphics and has other niceties such as an infrared port that go beyond the Portfolio. But it did come out considerably later than the Portfolio.

Petey-boy seems unaware or unwilling to disclose more VERY important
details. With most digital cameras that mere mortals can afford, the
resolution is indeed shitty. Most haven't even kept up with screen
resolutions (such as 1024x768).

This is VERY different from a real camera. The resolution of a real
camera is such that one can enlarge the picture to fill an entire
large cinema screen with no loss in clarity. Digital Cameras, on the
other hand have resolution more on par with NTSC and inferior to PAL.
One only needs to walk into a TV store to see just how soon NTSC, or
Digital Camera Quality, images loose clarity.

A cheap (motorized) hand scanner can to truecolor at 300 dpi.
Pete's beloved Digital Camera will do about half that.

This doesn't even touch upon the only slightly more expensive
flatbed scanners (SCSI).

Wake me up when these Digital Cameras can manage the same performance
as any color scanner at the same price & the image size wont be
obsolete in 3 years...

>
>Still an extra as well in cost to add functionality..

Still slightly less expensive than Mac OS. Just because Apple add the
cost of the OS to each machine doesn't make it free.

>> Not my fault that Apple don't have the ability to program on a
>> platform like mine.
>
>No market. Available on the other platforms..
>
>> It hasn't just shown up, I think Gemview supported it in about 92/93,

>Mac through a serial cable hookup usualy through the printer or modem port..
>
>The digital cameras are increasing in resolution quality at the same level
>pricing as the previous. This will be the case with the upcomming Quicktake
>200 camera.

I've seen reviews of the Apple camera (150) and it's rated as one of the
worst ones (just above the Casio QV-10a), the pictures look poor in
contrast, it gives banding on any feature with continuous tones like
sky and also apparently the viewfinder is arse. And this all for a
snip at just under 500 UKP. And you can't link up a quicktake that
doesn't exist like the 200.

>> There is a limit to how far you can take a product, if it isn't broken
>> then don't fix it. There is no point in just adding features that
>> virtually nobody will ever use just for the sake of it.

>
>What an excuse. There will aways need to be an upgrade to remain competitve
>and iron out bugs..

And if there aren't bugs and little competition? The Atari OS has
remained more compatible and stable than virtually any other that
springs to mind, you either get incredibly complex programs that bug
out like mad or just don't ever seem to crash. Most products have
been built up and updated through years and years, any bugs that
aren't found yet aren't worth fixing. This genuinely isn't an excuse,
I can't think of any feature that I want added to any of my main
software products.

>> Your keyboard must be incredibly inefficient with all those extra
>> keys then.
>
>In what way?

You said (in the bit you conveniently snipped) that a one button mouse
was more efficient than a 2 button mouse just because it has 2
buttons, therefore your keyboard must be more inefficient than mine.

>> The recieving end of what? When it is percieved to be overpriced by
>> people that haven't seen it (especially by you) then this means
>> absolutely nothing to me.
>
>PhuleAze..An 030 in 1996! Nuff said..

Again, no reason, no argument. You haven't ever seen it but you have
decided to dislike it straight away. Hardly a reason to reject a
machine.

6316. Atari Computers for sale...cheap!

Newsgroup: comp.sys.atari.advocacy
Date: 1996-11-15 00:00:00 UTC
From: kmiller@mines.edu
Message-ID: <NEWTNews.848073650.25206.kmiller@int2.mines.edu>
Source record: 7775
Cross-posted to: rec.games.video.marketplace,rec.games.video.classic,rec.games.video.atari,comp.sys.atari.st.tech,comp.sys.atari.advocacy,comp.sys.atari.8bit,alt.atari-jaguar.discussion

Hi,

I have several accumulated Atari items that I'd like to sell.
The reason is not only growing disenchantment with the
support of Atari products by not only the 3rd party developers,
but also a seemingly loyal secondary and primary retail market.
I just can't make the things do what I need them to do anymore.
But, I guess my lose is your gain. I have 8-bits, Jaguar stuff,
ST stuff, and just some other stuff and remember: THE PRICES ARE
NOT CUT IN STONE...if you have an ideal price (not free!) then we can talk.
All items work as of Friday at 8:00 in the morning!
Shipping is extra.

ST stuff:
Whoever buys these will get half of my software collection
including a ram disky thing from ANTIC, ST Word, etc. Quite a deal
at no cost to you.

1040STf works perfect and is a cosmetic 9.0! Disk drive perfect, etc.
Includes working mouse and some docs $50

520 ST upgraded to 1 meg...you know the story! Includes mouse and
some docs $40

SF314 (2) disk drives with cables and docs and connection cords $25 each

SC1224 (?) the colour monitor with box. No burn-in works well.
I've never had a problem with it. Docs included. $45

SC124 (?) Mono high res monitor. No docs or box but still works
like a gem. $35

SF204 HDD 20 meg (can you dig it?) hard disk drive. Works well
comes with all software preloaded to make it go once attached to
your Atari computer. $50 (I paid $90 :-()

8-bit computers. As above, all work well and are cosmetically
near mint...at any rate they have been well maintained. All
items come with cords and power supplies, and some come with the
original docs and boxes.

400 you know the story. Includes docs for 400/800. Can I
pay you to tow it away. Cosmetically, this is about as perfect as they come.
$ 20

800XL works nice, just not my cup of tea. Even comes with original box...
hey, it's America! $40

65xe works well. comes with original box. I;'ll include the docs
if I can find them in my closet. $40

130xe How can Toad charge $100 for these things? No box but looks
and works like day 1. $50

1050 disk drives. Nothing fancy, but power supply included. One of
them come with a box, the other...does not! $45 each

835 modem...viva 300 baud! perfect condition! $15

I also have some carts for the 8-bit like Assembly Editor,
BASIC, and some games. Will include with first purchase for
$2 each.

2600 works well but no power supply or docs. Several games.
$15

Jaguar game console plus 3 controllers. All cables, cords, etc.
two controllers are the regular black ones and the other is
a rare prototype grey one with blue buttons (available separately
for $25). I'll includew with the purchase of the Jag several carts like
Alien Vs. Predator, Checkered Flag, Power Drvie Rally, and...CYBERMORPH!
Jag comes with box and most game come with boxes...not all mind you.
whole package...minue proto controller $60

That's all...thanks for looking!

karl.

QuickTime is not an animation format so your statement is necessarily false
unless you have never encountered any real animation formats. In that
case your statement is only vicariously true. Could you please explain
what you meant?

What do you expect? No one supports Atari users but themeselves alone, along with Apple II users, Commodore Users, Adam users, TI/99, and a whole host of others......the Atari is not unique. "COMPUTER"="IBM or CLONE" is reality now.

: Jaguar game console plus 3 controllers. All cables, cords, etc.
: two controllers are the regular black ones and the other is
: a rare prototype grey one with blue buttons (available separately
^^

This is nonsense! If it is a "Rare Prototype", I have 4 of them. The Blue button Jaguar Controller is merely the controller included with NEWER Jaguars.....there is one with each new Jaguar you buy, and Atari sent me one for "free" when I bought my Jaguar, which had "regular" black buttons.

: for $25). I'll includew with the purchase of the Jag several carts like
: Alien Vs. Predator, Checkered Flag, Power Drvie Rally, and...CYBERMORPH!

That's cool, so I wonder what types of games could be played on it? :)

As for the infrared port, I read that it wouldn't work on a ST computer
because the serial port is not like the PC's. But the direct connection
can be used only it's the same as a null modem, one file sat a time. But
using Ghostlink can make it easy. :)

Quicktime- the new cross platform video playback standard.
Just make sure that you have each manufactures extension in
your system folder.
You will need one for Radius, Targa, miro.....ect for optium
playback and hope like hell that they are compatible with
the latest Quicktime version. Strap in and get ready for a
jerky, blury rollercoaster ride. Or your can convert your movie
to Apple standard, or should I say substandard quality with
dropped frames and dithered pallet. Almost as good as MPEG
at it's highest compression setting, but the fat is still
included.

I'll bet the 433mhz Raptors don't use it:)

As you should be, since MacOS has other weaknesses like that (the memory
management springs to mind).

Dark history? The LCIII was a great machine for it's time? What was the point
you were trying to convey? An LCIII today is much useful the the 2-4 bit
color ST..

> just so some of their laptops can boot up :)

Apple did not release a new version for the laptops. The latest 7.5.5 will not work in the PB 1400's, so 7.5.3 is. Have to wait for 7.6 until January..

This is a beginning of a new thread I hope, but it has much to keeping the Atari spirit alive...though it has nothing to do with portible computers or any rantings from the Sinclap a.k.a The MacNerd (I hope)

On Sat, 16 Nov 1996, Steve wrote:

> Thank God we will no longer need to deal with the absolute

Can you believe people out there are still playing 2600 games? So I don't see anyone dumping Atari machines in a pit somewhere. And that doesn't even include EMULATION of Atari systems either. :)

> Join the Telegames list. As a result of the list, 4 new games will

Wow, can't wait to se Zero 5 on the Jag. The STe game looks awesome enough.

Hopefully, it will survive as a cult system much like the Vectrex. Too bad it lost a lot of creditiblity because of Atari and lazy programmers. :(

> How would you feel about Jaguar shareware and would you be willing to
> pay money for a hardware add on that allowed it? Developers Welcome.
> Vote for the games you want to see @ Kitten Litter
> http://www.dfw.net/~kitten/

First, make a Jaguar console that allows shareware games to be downloaded into it. Sony is coming out with a PlayStation that will do the same thing. Then also offer ST's as a means of a cheap development computer to code custom games. Maybe someone might be clever enough to make STOS

extensions for Jag games, so game making can be *that* easy! :)

Eric Noss

OK Pete your pathertic understanding of Atari systems has been known
for some time and your misconceptions have been corected many times
but sadly your understanding is still very poor, I will do the best
that I can to reverse what you just said in the hope that you will
grasp the reality.

"Interesting, you use an [Atari|ST] for newsreading and you have not
sold the Classic for years. So why are you pushing the Powermac and
PowerTowers if they have not been sold for some time?"

Understand it yet?

I don't think Atari bothered going very far with the 040 and the STpad
was scrapped late in development, but better to scrap it rather than
push it out and let it flop like I believe the Lisa did.

Sorry, but I'm not sure that I understand your post. I was pointing out that
a statement made by another poster is either false or entirely meaningless.
Are you making a different claim? QuickTime is not an animation format.
I don't understand why this is so hard to understand.

> I don't understand why this is so hard to understand.

Daaaaah!
No, QuickTime is a method with which different manufactures can
confuse the end user as to which product to purchase.
An example might be, compair the specs between two video capture
cards. Both are advertised to capture 640*480@ 30fps 24bit color,
both include Adobe Premiere, but one card is priced at $350.00 and
the other at $1000.00. Why not just go for the cheaper card if they
both support QuickTime? It's because while each utilize QuickTime
to communicate with the Mac O/S and hardware, both cards provide their
own methods for video compression and file format. Generally these
formats can not be played back on another machine unless that
products specific extension is available to it. Also, cards such
as the Targa or Miro or Radius must be present in the machine
playing back the video to obtain optium performance.
Now, by saving the format with a standard QT recognized type of
compression, the video is available for play on "any Mac", but
at a much slower frame rate and or reduced resolution than the
originating hardware.
So you could say that QuickTime is a good thing for Mac users
in general. It allows Photoshop to load a single frame from a
movie that was compressed with a format compatible with QuickTime.
It will allow compatible QT movies to be played back with Apples
movie player, Quick Flix or Avid Videoshop.....ect.
But what does it offer the person that wishes to produce professional
video output? Not much but compatibility with Apple Machines. It
makes it easier for Bill Gates to make his machines cross platform

compatible.
It all comes down to the capture card's hardware and software. Almost
all of the PCI cards available for the Mac can be used in a (sic)
Intel PCI based machine, or much better yet, a DEC Alpha machine.
The same card that is available for the Mac that mandiates the use
of QuickTime, can be used in the DEC Alpha under Windows NT with
out Apples QuickTime.
With this being the case, what I FIND hard to understand is, what
benifits do you think your machine has because it utilizes QuickTime
and TOS based systems do not?
I have yet to see ANY Mac be able to play back a Studio 3D 24bit
file. Most X86's can pull that off as well as any standard Falcon.
The only saving grace for the Mac O/S based machines for quality video
production software that I can see will be when Light Wave is released
for the PPC. To bad an 040 based Amiga with a Toaster or an 040 Falcon
with Expose will outperform all but the most expensive options for
the Mac. Probably because the DON'T utilize QuickTime.

Now, does it sound like I think that QuickTime is an animation format?

>

Hell, maybe when Apple starts charging for "Mac O/S 8 you'll be in line.
It will be funny when you have to start purchasing upgrades for the
software
that isn't compatible with the last O/S version you purchased.

Mike

As usual you type before thinking. We sell C-Lab falcons and DirecT60's every week.
I am not pushing them, I am selling them to people who want and need them. It
doesn't require a "push" to do this, the ,market is still good for us and we
expect it to continue for quite some time.

The grey/blue jag controller is called a Power Pad and was intended
for the Atari STE series of computers which support the Jagpad. The
color scheme matched the color of the STE better than the black one.

A real proto jag stick would be one of the square ones or the one of
the original hack jobs consisting of a 7800 joypad with extra buttons
wired together with a Star Raiders controller for the 2600.

I don't understand what you mean in this paragraph. Could you please explain it in a different way? I also do not understand the rest of your post. You suggest that the cross-application capabilities of QuickTime are useless because they do little to aide those doing professional video work. You also suggest that QuickTime actually slows down video playback. This is an interesting suggestion because I would have assumed that more time is spent inside the codec than in the generic QuickTime API code. If I am correct in this assumption then QuickTime can not be to blame for poor play back but, instead, the codec would be.

>Now, does it sound like I think that QuickTime is an animation format?

No.

>You had better do a follow-up on your sig line you copied. It was not

>Clancy that said that.

Actually, it was. Often times the Tom Clancy newsgroup degenrates into a PC versus Mac flame war because Tom Clancy makes a great deal of positive reference to Macs in his books. During one of these threads he stated what became my signature and I asked for permission to use it. He granted it.

Hi,

The sale has gone quite well, but there are a few things left to sell, and now
I'm pulling out all the stops!

Buy my entire collection of 8-bit stuff for $175 plus shipping!
This includes all power supplies and necessary connectors
to make the machine do what it needs to do! All items are in
perfect working order!

-1 65 xe
-1 130 xe
-1 400
-1 800xl
-2 1050 disk drives
-1 835 modem
-1 xm301 modem
-1 410 tape recorder...how do you make those damn things work?
-various cassettes and disks and carts to make the 8-bit go!
-FREE...2600 with carts to purchaser!
-anything else I can dream up!

I can't do any better than this...if you think the
prices are too high, please try to find half of this stuff
at this price. Additionally, for shipping cost, with purchase,
I will toss in a colour monitor and connecting cable to
attach the 65/130 xe to it...these cables are a pain in the
ass to find.

References upon request!

thanks.

karl.

About the Grey/Blue controller being a Prototype controller, EGM magazine did an interview with people from Atari awhile back(when they still covered the Jag) and the Grey/Blue color scheme was one of the TEST colors they were using. They had a couple different color schemes they were working on, but the Black/Red won!! They have a picture of an Atari employee (I can't remember who) that had a Grey/Blue Jaguar unit with the Grey/Blue controller.

I always cut .sigs as it's only polite, you moronic attitude does no
good, it's standard netiquette to cut things like .sigs out along with
useless quoting. If everyone had your attitude then nobody would do
anything. You have proved you know little about the Mac, less about
the atari, you can't construct a decent argument and you clearly have
nothing better to do with you "fabulous" computer than have poor digs
at other computer users. Don't add having no mind of your own and no
manners to the list.

I think that you will find the only way to know a lot about the Atari
is to use one but it appears you haven't even seen one for years.

: mean "NEWER" jags? The ones they just sent out to every store that
: are now selling at $50?

Yes, the units which are selling dirt cheap. They changed the buttons
to a blue colour. I don't think you have a prototype, unless you are
talking about something which is totally different from what I am.

: By the way, does anybody know if the Cybermorph units they are selling
: now are the ORIGINAL ones, with poster inside and original box
: with the unreleased games on it?

There are TWO sorts of Cybermorph....one is in a BLACK case, and the
other is in a GREY case. I figure that the Jaguar was going to be the
same black as the 7800 system once....hence the black Cybermorph...
I personally think the unit would have been a lot sharper looking had
they gone this route.

Being the "STOS" man, you sure outta know about coding in STOS. But at least with stuff like Missing Link, I was able to get far into it than I did before and that was for about two years.

Anyway, try writting a game like Heartland in nothing but machine language. AhHA!! :)

BTW, is it just me or is any C compiler on the ST a big pain to use? :P

If anyone doesn't remember, awhile back I was debating(?) with Peter Sinclap about still not seeing a viable PPC desktop that runs Intel programs. He tried to upped me one by saying they have workstations out that hase the PPC running Windoze NT. But you can't exactly go to Wal-Mart and buy one of those can you?

After reading about what PPC can do when it first came out, I have been awaiting for such a machine to compete with Intel in terms of running DOS and Windows programs. IBM was even planning to have an on-the-fly Intel to PPC translator chip. But to this day, I only see PPC's on PowerMacs.

If what you say is true, working for Apple and all, then I can't wait for this machine to actually be sold on store shelves. And I bet by some means, it can run ST programs as well :)

Eric,

Thanks for not flaming. Sometimes these groups get way out of hand.
Anyways, we all know that timelines are subject to delays but it WILL
happen. Apple has also announced that we will have desktops by the end
of '97 that will do the same (I have been waiting quite a long time
myself for such a box!).

I don't know how hard it would be, but it is already being done for the
Sega Genesis. Right now I can subscribe to the Sega Channel from my
cable company. They would give me a hardware device that plugs into my
Sega Genesis and I hook the cable to it. Then I can download and play
as many games as they have on the cable each month (about 25).

Well Fudge! Thought I was passing along some useful info. Anyway, for
those that don't have it the number to call for a free catalog is:
800-826-5432. If you live outside the U.S. (I heard some people do)
send $2. They have all kinds of interesting (and sometimes useful)
items. Later.............................j

Uh, do you guys know that the original poster was talking about the change
in color of the fire buttons, not the numeric keypad buttons?

The controllers in question are *light* grey with *very* blue buttons.

Hint: The controllers are the same light grey as the Atari Falcon
computer.

Hint #2: The Atari Falcon has a 15-pin joypad controller port.

I think these things are rare, but I've heard enough reportings of them to
make me think they were a small production run, and not a proto.

> The idea behind OpenDoc is that instead of companies building monolithic
> applications that do everything, companies write small parts that do one
> specific task very well.

First of all, sorry about taking so long to reply -- I don't normally read
comp.sys.atari.advocacy, and just found this article via DejaNews.com

Now, why is it that one can never read a message by an OpenDoc supporter
without seeing OLE described using the phrase "building monolithic applications".
It's amazing -- Apple must have really driven that point home with you guys.
Too bad it's wrong!

Let's take, for example, a comparison of Cyberdog (based on your
description,since I've never seen it) and Microsoft Internet Explorer. MSIE
also comes with a news reader, a mail reader and a web browser (along with a
cool graphic chat module, and a online confernecing module), but has
componetized them enough that they are all separate executables, although they
do all interact with each other, and they too can be replaced if you really
want too (with the replacement still interacting). By that measure, Cyberdog
is more monolithic that MSIE.

But that's not the point. The essense of Component Programming is not to
allow the end user to recreate their apps in some Frankenstein manner. It's
to allow programmers to create new application based on very (very!) specific
components.

Let's now look at the MSIE Web Browser. From your description, under
OpenDoc this would be considered one part. Under OLE/ActiveX, it's DOZENS!
For example, the toolbar running across the top is one ActiveX control.
The Edit line holding the URL is another. The HTML Windows inwhich the
document is displayed in a third. The modules which interpet the Java,
JavaScript, and VBScript programs in the documents are three more.
And so on, for all the pieces.

The advantage of this is that all these controls are readily available.
The code for the toolbar is shared by all of MS's applications -- and it can
be used by ANY rogram that wants a toolbar.

And the same deal applies to the WebBrowser window. Ever want to draw a complicated design for the background of an application you were writing? Just plop a WebBrowser window into your application, and pass it a URL (on the net, or a local file) of a HTML document, and it will display it.

Need a scripting language for your app? Well, once IE3 is installed on the user's machine (A step which can be skipped when Win97 is released), you have -three- available (Java, JavaScript, VBScript). Then, all you have to do is expose objects that control your app, and viola. (ie, If your application has an objects called Widgets which understand Whack methods, then scripting engine will handle the rest of the processing of:

```
int i;
for (i=0; i<5; i++)
Widget[i].Whack;
```

```
-- or if you prefer basic:
for i = 0 to 4
Widget(i).Whack
next
```

>Because OpenDoc parts all share data and interact with each other seamlessly,
>you can build your perfect tool! You can buy a text editor part from one
>company, a spell-checking part from another, a grammar-checking part from
>a thid, a drawing part from a fourth -- instead of buying one monolithic
>application that does everything, but may not do everything the way you
>like it. It allows for much more freedom.

Which is, of course, EXACTLY what OLE has allowed since version 1 (released in 1991). This is the big lie on Apple's part. They stress that they're a "better OLE". What they don't say is that they are a better OLE1, and ignore the fact that they goals were already bested by OLE2 (released 1993), and completely blown out of the water by ActiveX (OLE3; released Mar 1996).

> What's even better, OpenDoc is cross platform. It is an open standard that
>is not controlled by any one company, and the source code can be licensed
>and ported to any platform, even Atari.

This is the other big lie on Apple's part. OpenDoc is controller by two companies (Apple & IBM) throught a puppet organization they set up, CI Labs. (You'll note that all of CI Labs officers are employees of either Apple or IBM). And IBM's contribution was mainly some old patents for SOM & DSOM. All present development is being done almost entirely by Apple. This makes it EXACTLY as open as OLE/ActiveX (except that OLE has now been turn over to a real outside standards organization). The source code to OLE can also be licensed and ported to any platform (even Atari), and in fact, already exists on Win95(Intel), WinNT (Intel, Alpha, MIPS, PowerPC), MacIntosh, and several flavors of UNIX, which puts in on more OSes and hardware platforms (and by far more actual machines) than OpenDoc.

Mine didn't. See it as an OS upgrade.

: > : No market. Available on the other platforms..
: >
: > If there was a need, it'd show up.
:
: No need due to the dwindling TOS installed base plus the ones who have a dual
: platform.

Well, most needs are catered for on the ST. If there is no market, there
won't be any development.

: > Let's just believe him, he's the expert. BTW, Quicktime is probably the
: > most fucked animation format I've ever encountered. I can't really see any
: > function in it.
:
: Only to you..

Not really "only". Just because Apple added animation, is it great then?
It has amazing demands on the computer, only to play a 320x200 window of
animation.

: > I prefer putting the pictures on photos, then scanning them, for maximum
: > clarity, sharpness and resolution.
:
: Can do that to..But what if you do not have a scanner and film developing
: facilities..?

You mean you live that far off from civilization? Isn't there any
photoshop where you live? Only to you...
If you can afford the toy camera, you surely must afford some kind of
scnner.

: > That is the case with most computer technology.
:
: What is your point?

Your point isn't much wirth. Everything gets cheaper, and, ultimately,
superseded by updated technology.

: > Ironing out bugs is good, adding uselessness just adds more bugs and an
: > excuse to continue development.
:
: What denial..

Only to Sinclap...

: > In the same way that his mouse is inefficient with two buttons. Damn, I

You are genuinely pathetic. Grotesquely bad analogies will do nothing
to change the fact that QuickTime is an application level TOY used to
satiate apple customers. While everyone else is getting more bang for
their buck, Apple is putting TOYS in this weeks update of the OS. While
everyone else is getting decent VM (needed to cure the bloat), protected
memory and _real_ multitasking, Apple is snookering idiots like you with
TOYS.

It's genuinely pathetic when an orphan has more mature core OS options
than a company that occasionally is the biggest microcomputer producer.

Next time try; Toaster Oven. Although you'd probably f*ck that up too.

I apologise for the bad analogy but a bad analogy does not make QuickTime an animation format. Also, by what definition would QuickTime be considered application level? A toy is in the eyes of the beholder. I am not being snookered. One could argue that Atari users are being "snookered" as well because they have put up with a single user, non-distributed operating system for so long.

> It's genuinely pathetic when an orphan has more mature core OS options
> than a company that occasionally is the biggest microcomputer producer.

MkLinux has a much better core than TOS. Why don't you use that? Maybe "TOYS" have some value after all?

>MkLinux has a much better core than TOS. Why don't you use that? Maybe
>"TOYS" have some value after all?

Too late: Atari has had Linux for quite some time. If you wish
to play that game: Mac looses, to EVERYBODY.

No significant number of Mac users has the balls or the capacity
to deal with Linux.They're too used to being spoonfed by the UI.

They would be completely lost under Linux.

Atari options, however, don't require abandonment of the familiar
user interface or of old applications. Linux has this nasty side
effect. It is a shame that this is the only manner in which you
could get _real_ multitasking.

Atarians aren't limited by TOS. MagiC and Geneva effectively replace
the OS. While orphan atarians have these to choose from, the only
options that Mac users have that don't merely sit upon MacOS'es
rather rotting core, is Linux.
MkLinux has even less support than TOS in any practical sense.
Linux is far to user hostile for the typical Mac user to deal with as
well. I can just see the typical MacInfant attempting to compile their
own copy of XAnim... '-p

Soon, Apple will develop yet another entirely incompatible platform
out of it's frustration with not being able to deliver Copeland and
Mac Users will be much like AppleII users...

It seems the only way for Mac users to get a real OS is to
effectively abandon their own platform...

Actually, QuickTime does directly access video hardware.

>>MkLinux has a much better core than TOS. Why don't you use that? Maybe

I don't believe that the linux kernal supports SMP and distributed
applications. The Mach kernal used in MkLinux does and I don't
believe that there is an Atari version of MkLinux. Please correct
me if I am wrong.

> Atari options, however, don't require abandonment of the familiar

So it is a trade off. You trade an architecturally superior operating system
(MkLinux) for a better interface and old applications. Mac users make
that same trade except that their operating system is even more
architecturally inferior. They get more applications and, arguably, a
better interface.

> Atarians aren't limited by TOS. MagiC and Geneva effectively replace
> the OS. While orphan atarians have these to choose from, the only

These replacements do not have the architectual strength of linux so
you are still making a trade.

Here are some improvements that the Macintosh should implement.
A key combination to switch through many applications.
Windows that can be resized without being activated.
A way to make a certain application deal with certain files.
It would be nice to not have the creator app open all.
Dynamic allocation of memory.
Easy way to put a picture on the background
Move to swtich extensions to applications.

Atarians don't need to make such drastic tradeoffs.
They don't need to choose between either a nice interface
or a robust OS. Linux doesn't necessarily require such
spartan measures. It just does if you're using MkLinux.

>architecturally inferior. They get more applications and, arguably, a
>better interface.

Yet Atarians can get an architecturally superior OS and not have
to sacrifice either ease of use or applications. Atarians can have
both; Mac users can have either.

>
>> Atarians aren't limited by TOS. MagiC and Geneva effectively replace

Macs must make an all or nothing choice. Atarians, and everyone else,
are not so limited. We don't have to deal with what an industrial
strength OS entails to trump the MacOS or TOS.

Atarians don't need to become unix sysadmins just to get a more
robust system, Mac Users do. It's actually quite ironic: in the
end, Mac Users have to become masters of the evil CLI just to get
a decent OS.

I'm not sure what you are arguing. Are you saying that the Atari
implementation of Linux is easier to use than MkLinux for the Mac?

> Yet Atarians can get an architecturally superior OS and not have
> to sacrifice either ease of use or applications. Atarians can have
> both; Mac users can have either.

I don't understant what you mean. What OS are you refering to?

> Macs must make an all or nothing choice. Atarians, and everyone else,
> are not so limited. We don't have to deal with what an industrial
> strength OS entails to trump the MacOS or TOS.

My point is that you still must make a compromise. How you make that
compromise is a matter of taste.

So, if QT is an engine, what format does that engine use for its files?
Also, it's strange that so many animation programs insist on using QT for
saving/loading/displaying animations.

Linux is distributed as source. With the exception of commercial
vendor support, there is likely no difference between what can
be done with the various Linuxen.

Your concept of compromise is rather bizzare. Linux and MacOS are about as opposite as extremes get. A choice between one or the other is no compromise; it's a fundemental paradigm shift. This would be especially so for the vast majority of Mac Users.

More robust, but not industrial strength is a compromise.
Less bulletproof, but more cross (or back) compatible is a compromise.

What you would pass off as compromise is anything but...

I get the impression that you have absolutely no clue as to what would await you as a Linux user, especially as an MkLinux user.

I wouldn't expect user numbers for MkLinux to exceed those of the 68K platforms anytime soon...

> vendor support, there is likely no difference between what can
> be done with the various Linuxen.

It is interesting that you latter claim that I could not comprehend MkLinux when you do not even seem to understand what a distributed operating system is. A distributed operating system allows programs to (easily) distribute chores amongst workstations. The Mach kernal provides such a facility but I do not believe that the linux kernal does. SMP is symetrical multiprocessing which operating systems use to symetrically schedual processes amongst several processors. I believe that only rudimentry support for SMP is available in vanilla linux.

> about as opposite as extremes get. A choice between one or the other
> is no compromise; it's a fundemental paradigm shift. This would be
> especially so for the vast majority of Mac Users.

You are correct. I was using the word compromise incorrectly since compromise precludes choosing an extreme. I still maintain that Macintosh users are still making a reasonable decision by weighing the GUI and API features more heavily than the operating system core.

> I get the impression that you have absolutely no clue as to what
> would await you as a Linux user, especially as an MkLinux user.

Actually, I have been using MkLinux since DR0. I don't understant why you think that that MkLinux is more difficult to use than vanilla linux. They differ only in kernal architecture and that is abstracted away from the user.

> I wouldn't expect user numbers for MkLinux to exceed those of the
> 68K platforms anytime soon...

I would expect this as well but I don't understant your point.

The QuickTime engine doesn't care what format the data is in so long
as the data has a valid QuickTime header and it can access a codec that
supports the format in question. Actually, I believe that if the data
does not have a QuickTime header then QuickTime will attempt to deduce
the information that would be contained in the header. Most programs
insist on using QT because they do want to reinvent the wheel just to
manipulate video.

Does the kernal provide a frame work for distributed applications?
Thanks for the SMP info. I didn't know the linux kernal supported it
to any degree.

I believe that I correctly interpreted his post and that he is, in fact,
wrong. As an interesting note, all linux kernal calls are handled by
operating system code which directs the calls to the Mach kernal. So
even code that directly accesses the linux kernal is portable to MkLinux.

It seems now that you do understand what I said earlier.
Is there an MPEG codec for Quick Time?

> Actually, I believe that if the data
> does not have a QuickTime header then QuickTime will attempt to deduce
> the information that would be contained in the header.

Ok, if that is the case, try running an Autodesk Studio 3D file.
Let it "try".

> Most programs
> insist on using QT because they do want to reinvent the wheel just to

Not most programs, only Apple compatible applications. (few PC).
Don't forget where your are.
Are you saying that, for instance, the Video Toaster Flyer
format is inferior because QT is not used?
Now theres a laugh. I may have to get shitty and cross post
this to the Amiga advocacy.

Mike

: > You're misinformed.

: In what respect? The linux kernal does support SMP and distributed
: applications?

Yes. The distributed applications part obviously requires a program
that supports it, but the kernel does do SMP (Admittedly, not well.
That's one of the goals for the 2.1.x series of kernels: get _good_ SMP,
not just SMP).

: > Atarians don't need to make such drastic tradeoffs.
: > They don't need to choose between either a nice interface

: > spartan measures. It just does if you're using MkLinux.

: I'm not sure what you are arguing. Are you saying that the Atari
: implementation of Linux is easier to use than MkLinux for the Mac?

I can't tell if that's what he's trying to say, but if your
interpretation is correct, he's wrong. All MkLinux is a Linux built on
top of the Mach microkernel. Mostly the same, with the innards a little
different. To the application, it's mostly the same, although there is a
version X for MkLinux which uses Mach calls instead of Linux ones. (BTW,
there's a PPC Linux project in the works)

A format is an arrangement of data. A format cannot use QuickTime.
A QuickTime codec can support a format.

That is what I think. Some tool just bought them all up hoping to double his money over the next 6-12 months. It's great to think that 4Play or someone did this as part of a greand scheme that would have meaning... But if that was the case I think it would have been done earlier. So I suggest that if there comes a time were a person selling pads is a likely suspect--boycott them. Even if it means having to pay more for your own pad (unlikely really). If they had been ProControllers I would have had my order in when I first saw the post...

6425. Repost: 603e faster than 601?

Newsgroup: comp.sys.atari.advocacy
Date: 1996-11-23 00:00:00 UTC
From: Paul@pwomar.demon.co.uk
Message-ID: <848800236_OASIS_@pwomar.demon.co.uk>
Source record: 7734

I posted this last week but Pete didn't manage a response so I guess
he didn't see it, so Pete a response would be nice.

Whilst looking through a Mac catalogue that I saw some oddites in the
Mac pricing and so decided to ask here about some chip details, Pete
replied:

In article <1996Nov8.192554.1@cobra.uni.edu>
sinclap2954@cobra.uni.edu (PETER SINCLAIR-DAY) said:-

>The 603e has replaced the 603 and blows away the 601.

Well I knew the 603 wasn't as good as the 601 in the first place and
(foolishly) accepted what Pete had said about the 603e. Today whilst
in the newsies I tried to find out what sort of performance difference
there was between chips and found out that the 601 is actually better
than the 603e. I also asked a few people that I know on IRC (Mac
owners) and they said the same thing so it appears that not only does
he not know about Atari machines he doesn't even have the facts
straight about the Mac range. I always knewhis oppinions were out of
sync but he doesn't even know about the power of the processors. It's
hardly surprising that he can't construct a decent argument.

> A QuickTime codec can support a format.

God, your learning well from SinPlop. So your saying the QT is a
limitation
on the Mac platform? I don't understand. Please explain how QT
"modernizes"
video playback on other platforms? I wasn't asking for a lesson in
terminology. I'm illiterate remember? I use an Atari. What I was
poking at was your statement to the effect that QuickTime is
THE best way to support video on any platform. You are grossly
mistaken with this statement.

MPEGDSP supports MPEG play back on the Falcon.
APEXFLC.GTP supports AutoDesk Studio 3D files.

AQTPLAYER supports QT playback
PLAYAVI supports AVI playback
and a few others. All without QuickTime.

Mike

I don't know who you talked to, currently the 603e processor exceeds the previous 601 speed wise. The 601's fastest speed that was used topped at 120 mhz.. Currently the 603e fastest speed is 240mhz when PowerComputing ships them in December. However, a 300mhz one will be on deck by mid '97'...

The slowest 603e machine being shipped today is the 160mhz Performa 6360, Starmax 3000, and Umax C500. No one is shipping 100-120 mhz ones today..

So I stand correct, that 603e's are faster.. What part do you not understand?

Perhaps he does do Digital Audio, video capture or something similar?
Perhaps he uses MagiC and runs several applications at once (remember:
TOS/MagiC does not ship with VMEM)? And - Petey-boy - a Falcon's ST RAM is
either 1, 4 or 14 (plus two unusable) megs, 8 would suffice, 4 are a bit
too low (IMHO) and a 1 meg Falcon is a joke.

Not really, unless you spawn off child processes and have them do stuff.
The basic idea with SMP support was to let people with SMP motherboards
use all of the processors. I think that LinuxThreads (a kernel patch to
allow threaded applications) can put different threads on different
processors, but I'm not sure.

Can you serve or send remote procedure calls using the linux kernal?
I suppose that RPC could be handled above the level of the kernal,
does vanilla linux do it that way?

Actually, neither of you are right. :)

100 MHz 601: SPECint-92 105, SPECfp-92 125
100 MHz 603e: SPECint-92 120, SPECfp-92 105

So, according to SPEC (which is generally regarded as a reasonable comparison benchmark), a 601 is better if you want to crunch floating point numbers, but a 603e is better for integer programs.

However, there are other factors. The 601 is not available with a clock speed higher than 120 MHz. The 603e is currently available at 100 to 240 MHz. The 603e consumes less power, and is also less expensive to manufacture. So, for these reasons, one might say that the 603e does in fact "blow away" the 601, even though it does not if the clock speeds are the same.

(For those interested, a 68040-25 scores 21/15 and a 68060-50 is estimated to score 60/45. The estimate was based on the assumption that the 50 MHz 060 would be 3x faster than the 25 MHz 040. You can find the table I got all these numbers from at <http://genex.hgu.mrc.ac.uk/~dubreuil/cputable.html>.)

> I also asked a few people that I know on IRC (Mac
>owners) and they said the same thing so it appears that not only does
>he not know about Atari machines he doesn't even have the facts
>straight about the Mac range.

Some of Apple's 603 or 603e machines are misleading. Probably for marketing reasons (IMHO), Apple crippled some of the 603/603e models with one or more of the following things: a narrow data bus (32 bits instead of 64), a slow data bus (33 MHz), no L2 cache.

The original 603 also has Mac-specific performance problems. Apple's 68000 emulator code was written for the 601's 32K on-chip cache. The 603 has 16K of cache, which seriously hurts emulator performance. (The 603e has a 32K cache.)

In article <848414750.3658@dejanews.com>, JamesCurran@CIS.CompuServe.Com wrote:

|>> The idea behind OpenDoc is that instead of companies building monolithic
|>> applications that do everything, companies write small parts that do one
|>> specific task very well.

|> First of all, sorry about taking so long to reply -- I don't normally read
|>comp.sys.atari.advocacy, and just found this article via DejaNews.com

I usually don't read this newsgroup either and just accidently read your post - but nonetheless it seems to be necessary to correct some opinions concerning OpenDoc that are obviously wrong.

|> Now, why is it that one can never read a message by an OpenDoc supporter
|>without seeing OLE described using the phrase "building monolithic applications".

Is this the fault of the OpenDoc supporter or the fault of OLE? Let's simply see ...

|> Let's take, for example, a comparison of Cyberdog (based on your
|>description,since I've never seen it) and Microsoft Internet Explorer. MSIE
|>also comes with a news reader, a mail reader and a web browser (along with a
|>cool graphic chat module, and a online confernecing module), but has
|>componetized them enough that they are all separate executables, although they
|>do all interact with each other, and they too can be replaced if you really
|>want too (with the replacement still interacting). By that measure, Cyberdog
|>is more monolithic that MSIE.

I don't understand your point. Just because MSIE can be split into several apps that can be replaced makes Cyberdog more monolithic than MSIE? Even without OpenDoc you can have (on the Macintosh) a WWW-browser, a NewsReader, an email-client ... (continue list with all client services you need) and the applications will interact (e.g. double-clicking a URL in the newsreader will launch the appropiate client etc.). You can choose whatever program you like for a particular service, but you only have to

enter your personal details once (email-address, mail-, news-servers,
signatures, etc.). THIS kind of behavior is standard for Mac-users.
Windows must really lag farther behind MacOS than I ever thought if you
consider this behavior noteworthy in any way. In this case OpenDoc must
really be hard to describe to Win-users ... ;-)

|> Let's now look at the MSIE Web Browser. From your description,
under
|>OpenDoc this would be considered one part.

No, it wouldn't (it is difficult to discuss several possibilities HOW one
would actually implement MSIE under OpenDoc) ... but let's continue ...

|> The advantage of this is that all these controls are readily
available.
|>The code for the toolbar is shared by all of MS's applications -- and it
can
|>be used by ANY rogram that wants a toolbar.
|> And the same deal applies to the WebBrowser window. Ever want to
draw a
|>complicated design for the background of an application you were
writing? Just
|>plop a WebBrowser window into your application, and pass it a URL (on
the net,
|>or a local file) of a HTML document, and it will display it.

THIS is something more exciting ... but this is not an advantage for the
end-user, but for a developer. However, this starts to get closer to what
OpenDoc actually is.

|>>Because OpenDoc parts all share data and interact with each other
seamlessly,
|>>you can build your perfect tool! You can buy a text editor part from
one
|>>company, a spell-checking part from another, a grammar-checking part
from
|>>a thid, a drawing part from a fourth -- instead of buying one
monolithic
|>>application that does everything, but may not do everything the way you
|>>like it. It allows for much more freedom.
|> Which is, of course, EXACTLY what OLE has allowed since version 1
(released
|>in 1991). This is the big lie on Apple's part. They stress that
they're a
|>"better OLE". What they don't say is that they are a better OLE1, and
ignore
|>the fact that they goals were already bested by OLE2 (released 1993),
and
|>completely blown out of the water by ActiveX (OLE3; released Mar 1996).

Well, OLE 1.0 didn't work properly with non-MS-apps (a friend of mine
didn't manage to embed Corel Draw-documents into word documents). Even

MS-apps didn't work properly (once you moved the original document, it was over). Maybe it works better now (the problem with moving files has been solved by some dirty hacks AFAIK), but let's focus on the comparison OpenDoc <-> OLE 2.0 (both from the end-users' and the developers point of view):

Opendoc ist document-centric (unlike OLE which integrates applications' functionality). This means you start from an empty document and edit it with part editors. These parts can be all different kind of data you might imagine (text, graphics, movies, WWW-pages, ftp-transfers, ...). The parts (of the document, NOT of an application) can be irregularly shaped and can even overlap each other. Furthermore, you can have several parts "active" (whatever this word means for the specific kind of data under consideration) at a time. You can activate a part and (if you have the appropiate editor) interact with it. Now let's compare this with what I know about OLE 2.0 (well, I'm not a Win-user, so this information is rather 2nd and 3rd hand - just correct me where you think I'm wrong): You launch a specific OLE-aware application and work with it. Then you can launch different applications and share information between the applications and even integrate the data from one application into the working page of the other application. But AFAIK the objects on a certain page cannot be overlapping and they cannot have an arbitrary shape. And still you have to launch all big apps separately - yes, the app may consist of several parts, but can you buy them seperately and can you COMBINE them in the way YOU want? Can you e.g. use the spellchecker from Word to correct some text you wrote in Corel Draw? Or do you have to use Corel Draw's own spellchecker? (;-)) Oh, you want to use Word for setting any text in Corel Draw? Then you certainly want to use Excel for all numbers in your drawing as well? And you want to have all these three applications open at the SAME time? Then we might start to consider importing movies and internet documents ... What, you have less than 64MB of RAM? And you STILL cannot have all five data types be active at the same time ...

From the developers point of view you have no official test of OLE 2.0 compliance. This means that OLE is just some kind of Russian roulette since you never know if your applications interact or not. (CI labs can validate your software and check if you comply to OpenDoc specifications.) You mentioned above how it is possible to integrate functionality from other OLE-aware applications. OpenDoc can do the same, but you even can inherit functions of a specific class and MODIFY them to your specific needs.

Finally we could discuss what is done from the user's POV if he wants to share OpenDoc-documents. He can exchange the data with somebody, who does NOT NEED to have the original application that created a part of the document. He only needs a viewer for all part types. Can a Windows user only SEE a Word-document that contains (parts from X apps) if he is running StarOffice on his system (without having all X apps installed)? Can you say "import filter"? I knew that you can!

I could now go into the secturity problems with ActiveX-controls (especially if you download them as binaries over the WWW to make some pages look better), but you seem to be quite competent and probably know more about it than me. I would say you could call it "blow in the water". In German this would mean "a complete failure", since there were already severe security problems with Java code (which HAS some security mechanisms) - MS's idea to not have any proper security mechanism at all is something that should make anybody hope that ActiveX will fail ...

|>> What's even better, OpenDoc is cross platform. It is an open standard that
|>>is not controlled by any one company, and the source code can be licensed
|>>and ported to any platform, even Atari.
|> This is the other big lie on Apple's part. OpenDoc is controller by two
|>companies (Apple & IBM) throught a puppet organization they set up, CI Labs.
|>(You'll note that all of CI Labs officers are employees of either Apple or
|>IBM). And IBM's contribution was mainly some old patents for SOM & DSOM. All
|>present development is being done almost entirely by Apple. This makes it
|>EXACTLY as open as OLE/ActiveX (except that OLE has now been turn over to a
|>real outside standards organization). The source code to OLE can also be
|>licensed and ported to any platform (even Atari), and in fact, already exists
|>on Win95(Intel), WinNT (Intel, Alpha, MIPS, PowerPC), MacIntosh, and several
|>flavors of UNIX, which puts in on more OSes and hardware platforms (and by far
|>more actual machines) than OpenDoc.

I have to agree that OpenDoc is not as "Open" as the word might suggest (on the other hand which service that starts with the word "open" is truly an open service?). But I can't agree if you say that OLE is multiplatform - the only platform where you might WANT to use OLE-aware-apps and take advantage of their powers is Win95 and WinNT (Intel). The other platforms don't have appropiate applications (except perhaps Office for Macintosh, which is also an MS app).

Hmmm, let's have a look at this number...

Mac has about 10% of the market (According to some Mac-clone manufacturer, who wants to increase this to 25%!), Micro$oft something like 80-85%. This indicates that there are about 480-500 MILLION Windows-systems out there! Strange, since this number is at least 3 times what Micro$oft themselves claimes to have sold.

And to use your own argument, 480 million Windows-users can't be wrong! Windows is 8 times better than MacOS!

Yes. There is a program called AVI -> QuickTime that will make AVIs
playable on your Mac. The program is only about 8K and all it does
is replace the AVI header with a QuickTime header.

The apps are very efficient, however data is data, picture and
sound files tend to be huge by their very nature. It's nice to have
quite a few megabytes of space to work in.

Correct. But all it does is change the header so it's quick and doesn't consume any disk space during the conversion process. The modified file will be exactly two bytes larger than the original. I don't know if the program goes both ways or not.

There is an application called AVI-Quicktime that
you should find at most Mac graphics sites that
will do the job for you.

Gezz, now I feel so low for admitting I know
about this:(

Mike

>mhz.. Currently the 603e fastest speed is 240mhz when PowerComputing ships them
>in December. However, a 300mhz one will be on deck by mid '97'...

I understand that higher speeds are available I thought that was
fairly clear, I was talking about how 2 similar Mhz rated chips would
compare. I accept that you misunderstood the point of the question so
forget it.

>The slowest 603e machine being shipped today is the 160mhz Performa 6360,
>Starmax 3000, and Umax C500. No one is shipping 100-120 mhz ones today..

>
>So I stand correct, that 603e's are faster.. What part do you not understand?

I didn't think it was appropriate to compare different speed chips
when taliking about chip power, a 117 Mhz 603e in a Powerbook (I
believe that exists) is not even close to the speed of a 120 Mhz 601
according to the magazines I read and the people that I spoke to and I
wouldn't call that blowing the 601 away.

Michael Grove <mgrove@ridgecrest.ca.us> writes:

>Ok, tell me where this extension (or codec as you perfer)
>is located. I want to be able to display MPEG video from the
>desktop (excuse me, finder) using the Apple Video player.

You could start at http://www.apple.com and I believe that the program
you are refering to is MoviePlayer.

>I though you said that it would "try" to resolve the files headder.
>Why didn't you say it would fail in the first place?

Doesn't the word "try" imply that failure is possible in some instances?
To build an appropriate header, QuickTime needs to understand the
data format. For example, QuickTime can play MPEG files without a
QT header because it understands the data format and can construct
the information on it's own.

>God, your learning well from SinPlop. So your saying the QT is a
>limitation
>on the Mac platform? I don't understand. Please explain how QT
>"modernizes"
>video playback on other platforms? I wasn't asking for a lesson in
>terminology. I'm illiterate remember? I use an Atari. What I was
>poking at was your statement to the effect that QuickTime is
>THE best way to support video on any platform. You are grossly
>mistaken with this statement.

I'm not trying to insult your literacy but I couldn't understant what
you where trying to say. Place the blame on me. And could you please
find the quote where is said that "QuickTime is THE best way to support
video on any platform".

>MPEGDSP supports MPEG play back on the Falcon.
>APEXFLC.GTP supports AutoDesk Studio 3D files.
>AQTPLAYER supports QT playback
>PLAYAVI supports AVI playback
>and a few others. All without QuickTime.

Actually, I think that you are proving that QuickTime (or any system wide
multimedia engine) can be of use. All the programs you listed must
share some common functionality that each needed to reimplement.
QuickTime gives programs a easy way to manipuate multimedia data without
duplicatating common functionality. I am not suggesting that other
systems do not or could not exist. The ImageVision Library that is
part of IRIX is also quite nice.

Source record: 7740

I'm not defending Peter but in some ways the 603e chip is better than the 601 chip. The 603e chip can complete more integer instructions per cycle than the 601 but less floating point instructions. The 603e chip can have a higher cycle speed than the 601. The 603e also consumes less power than the 601.

:
: So you need 16 megs...I thought Falcon users did not need that amount of
: memory because TOS apps are soo efficient..)
:
: So much for the myth..

I upgraded to give myself a bit more room for APEX media to do its magic.
Four megs was plenty for APEX, but sixteen is just sweet! :)

This is my setup:

MagiC4 running MAGXDESK in 640*480*256 with a large backdrop tile
Several ACCessories
Several AUTO folder programs (including NVDI 3 with a 0.5 meg font cache)
Several apps running in parallel with MAGXDESK

While running CoNnect right now, with a 1000 line scrollback buffer, I
still have 11.5 Megs free ACTUAL memory...

I would only have 2.5 megs free on a four meg machine (with an OS running
that is pre-emptively multitasking, something Mac CANNOT do yet)...

Sad really isn't it! :)

Chris W.

So much for your knowledge! What he refered to is the actual
size of the image in memory. Your thinking of coloring book pictures.
A 640*480 image is only a few centimeters at best. Hardly practical for
DTP on any scale except for the school news letter. The bottom of the
line
cameras, 1600*1200, reasonable for small 3*5 prints, run $3295.00 for
a 40 image Polaroid PDC-2000. Your still playing with K-mart toys.
Your stupidity is only preceded by the ignorance of your statements.

Macs, that have any use whatsoever, are expensive. A "good"
Mac starts at around $3500.00. This excludes your piece of shit.

Mike

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WEALTH!

Hello!!

Would you like to make thousands of dollars, quickly, legally, with NO CATCH? Then keep reading.....please take five minutes to read this article- it will change your life, just like it did mine. It's true! you can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize for wasting your time.

Here we go, A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks, with only an initial investment of $5! So, I thought, "Yeah, right, must be a scam".

but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1 to each of the 5 names and addresses stated in the article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it!

So after thinking it over, talking to a few people first, I tried it. I figured what have I got to lose except for 5 stamps and $5, right? Well, guess what....within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept coming IN, tripling in size and

multiplying by 10-20 times the amount that I got the first week! In my first week I made about 2- to 30 dollars. But by the end of the second week, I had made a total of over $1,000!!!!!! In the third week, I had over $10,000 dollars, and it's still growing! This is my fourth week (Nov 13) and I've made about $42,000 TOTAL, and believe it or not the money is still coming in.....

Let me tell you how this works and most importantly, WHY it works...also, make sure you print a copy of this article NOW so you get the information from it, and begin making money.

The Process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 seperate pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST". YOU ARE NUMBER 4. get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, EACH having a piece of paper and the $1 bill inside.

NOTE: make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this.

This is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses.

1. Bruce, P.I. Box 63 4700 Keele St., North York, Ontario M3J 1P3
2. Lars Westin Bjï¿½rkvï¿½gen 3 740 12 Knutby SWEDEN
3. D. Hill, 4280 150 6 Ave. S.W., Calgery, AB, Canada T2P 3Y7
4. Mattias W sernanders vï¿½g 1 rum 535 752 61 Uppsala Sweden
5. Jeff Boldrick, RR#2 Tweed, Ontario K0K3J0

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, etc.) editing what you need to edit.

STEP 3: Post your amended article (with your name at #5) to at least

200 news groups (there are around 10,000 of them!!). All you need is say, at least 200. HOW TO DO THIS: If you have netscape 3.0 do EXACTLY the following:

1) click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box as it is, but CHANGE the subject box to somehting eye-catching, like, "NEED CASH $$$ READ HERE" $$$ or "FAST CASH" !!!

3) Tab once and you should be ready to type. Now, Copy and paste or retype (only once)

THIS WHOLE ARTICLE, word for word, except to insert your name at #5, and to remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the same.

4) When you're done typing(Copy/Paste) the whole article, click on FILE in THIS BOX,

right above send, NOT where it says netscape news on the first box. Click on SAVE AS when you're under FILE. Save your article as a Text file to our c: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTILL YOU HAVE SAVED IT. Once saved, move on to number 5 below.

5) If you still have all of our text. send or post to this newsgroup now by simply clicking send, which is right below AFILE, and right above the Cc: button.

6) Here's where you're going to post all 200. OK, click on any newsgroups then click on 'TO NEWS', again (in the top left hand corner of your netscape navigator. Leave the newsgroups box alone again, put your eye-catching title in the SUBJECT BOX, hit tab once you're in the body of the message, and then click on ATTACHMENT, which is below the subject box. You will get another box to come up. Click on ATTACH FILE, then find YOUR FILE THAT YOU HAVE SAVED; click once on this file, and then click OPEN. NOw click on OK. If you did this right, you

should see our file name in the attachments box, and it will be shaded green.

IF YOU USE I.E EXPLORER, IT'S JUST AS EASY: Holding down the left mouse button, highlight this article. Then press the "CTRL" key and the "C" key at the same, to copy this article. Then print this article for your records to have the names of those you will be sending $1 bills to.

Next, go to the news groups and press "POST AN ARTICLE". A window will open. Type in your headlines in the subject area and then click in the large windows below. If you want to edit the article, do so and then highlight and copy it again. Now everytime you post the article in a newsgroup all you have to reat is "CTRL" and "V" and press POST.

7) That's it! Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups. You See? Now you just have 100 to go!! (Don't worry, each one takes about 30 seconds, once you get used to it). REMEMBER, 200 IS THE MINIMUM. The more you post, the more money you will make.

You are now in the mail-order business and will start receivng your $1 enveloopes from various people all over the world, within days! HINT: THE MORE NEWSGROUPS YOU POST TOK THE MORE MONEY YOU WILL MAKE.

You may want to rent a PO Box eventualy, because of all the mail. If you wish to stay anonymouse, you can come up with a name, such as "manager" or " investor". Just make sure all the address that you have typed in for the 4 people plus yourself are correct, please.

LET ME TELL YOU WHY THIS SYSTEM WORKS!

Out of every 200 posting, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my name at #5. Now, each person who just sent me $1 makes, say, only 200 posting, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. So people send you $1 now-that's $50 you have just made! Next, your new 50 agens each post 200 newsgroups with your name at number #3, or 10,000 POSTINGS (50x200 = 10,000). The average return is 500 at $1

each, so $500. They make 200 postings, which is 5,000 returns at $1 each, which is $5,000 dollars! and finally, 5,000 people make 200 postings with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000 BEFROE YOUR NAME DROPS OFF THE LIST. AND THAT'S IF EVERYONE ONLY MAKES 200 POSTINGS, AND IF ONLY 5 PEOPLE RESPOND!!!!!!

When your name is no longer on the list, you simply take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5 TO THE NAMES ON THE LIST. PUTTING YOUR NAME AT #5 AGAIN. And start posting again. The thing to remember is, THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND READING THESE ARTICLES EVERY DAY- just like you are right now!!!

So can you aford $5 to see if it really works? I think so.....

People have said, "What if the plan is played out and no one sends you the money?"

So what! What are the chances of that happening when there are TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE who are joining the internet and newsgroups every day and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day with THOUSANDS of those actually joining the internet.

Remember, PLAY FAIRLY, AND HONESTLY, and this WILL WORK, I promise you!!!! You just to be honest. Make sure yhou print this article RIGHT NOW.

Also, try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

REMEMBER: HONESTY IS THE BEST POLICY! You don't need to cheat the back idea is to make money!

GOOD LUCK TO ALL PLEASE PLAY FAIRLY, AND YOU WILL REAP THE HUGE REWARDS FROM THIS-TONS OF EXTRA CASH!!!!

One last note: If you try to deceive people by posting the messages with your name on the list and not sending the money to the poeple

already on the list you won't get much.

Someone I talked to knew someone who did that and he only made $150 dollars, and that's after seven or eight weeks! Then he sent the 5 $1 bills, people added his to their list, and in 4-5 weeks he had over $10,000!!!

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING US ANYTHING BUT OUR TIME, $5 AND FIVE POSTAGE STAMPS!

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I'm not the only one that thinks that way either. It wasn't just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can't be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I'm 26 now and many of the things I'm telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say "You can do it... It'll be okay." I've never been able to make a good attempt at trying to repay her for all she's done for me and I'm not alone. Many people just have taken for granted the things she's done for them.

I know by now you're asking yourself why I've posted this letter. Well, to be honest and straight with you it's because I would like your help. If there's one thing that I've learned from Wendy it's that, "We are our neighbors keepers." You know the golden rule, "Do onto others as you would have them do onto you." Anyway now Wendy is an older lady that is disabled and can't do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can't be of much help. With no real family I'd like to do something to try to repay all she done for me and many others.

That's were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it's someone you can't even remember or have lost touch with. For that moment picture Wendy and say, "I'd like to repay that kindness." I wish you would sit down and write a small note saying "Thanks for being the generous person that you have been!" If you could include something to help out. Maybe it's a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin

sends his love. Her birthday is next month on the 27th and I'm hoping
I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

>Does that mean that Video for Windows and Quicktime are the same formats,
>or does QT have (more or less) built-in support for AVI?

Yes. The header used in AVI is exactly the same as the QuickTime header
save for two bytes that Microsoft removed. Apple sued Microsoft
over this and, surprisingly, won. However, since the monitary loss was
insignificant to Microsoft, a court basically sold the QuickTime header
format.

>
>This is my fourth week (Nov 13) and I've made about $42,000 TOTAL, and
>
>believe it or not the money is still coming in.......

Lets see, $32,000 in $1 bills in one week. That amounts to 32,000 letters. Since the post office does not deliver on Sundays, that means you received an average of 5,333 letters per day. If you sleep for eight hours a day, and spend the rest of it opening 5,333 letters, you would have to open one letter approximately every 11 seconds all day long without rest or food. You won't even have time to pay your bills or do other household chores. You'll also need to rent a truck to drive all that money to the bank and pick up your next load of mail because it will weigh about a ton. That means you'll need to cut into your sleep time and/or open the mail faster.

This is beside the fact that the bank, police, FBI, and the IRS will become very inquisitive over your repeated large cash deposits. Your home will probably be raided once or twice if not outright seized for probable cause of drug trafficing, money laundering/counterfitting, etc. The postmaster general will be after you to explain why you're suddenly getting so much mail. Somebody at the post office will go 'postal' because of the sudden manditory overtime to sort mail. The garbage collectors will fine you for

exceeding your weekly garbage limit, and much of it will remain on your lawn since they can't haul it all away. That means the city will be after you as well because of all the trash in your yard (not to mension that it hasn't been mowed in some time since you've been busy opening 5,333 letter a day). BTW, doesn't your finger get a bit sore and don't the papercuts hurt?

It goes without saying though, if you spam your message to 200 newsgroups, and only 15 people are dumb enough to respond and spam out another 200 messages per person, you will have ran out of news groups to continue the chain in. This is because there are only 3-4,000 newsgroups, not 10,000, and only about half of those see a significant amount of activity. Max profit for you is $15 income - $7 (investment + stamps/envelopes) = $8 net. Wow.

Your story is just a weeeeeee bit far fetched.

Isn't this how a business should work? Why boycott someone who found
out about a good deal, and wants to make a little bit of money on it?
The place that had them for $2.50 should've been asking for more!!!

(And no, it isn't me!! :-)

We are talking about the space data takes not the space that the
program itself takes up. Photoshop takes up a huge chunk of memory
before you have loaded any data.

You know, Degas Elite, NeoChrome, the latest MegaDemo...
Nope, I'd rather let the "pros" handle that, but take, f.ex. APEX Media,
most image processing programs (An image file isn't automagically shrunk,
just because the programs are), recording software, etc.

Sorry, I think that I might have been wrong about QuickTime 2.5 having a MPEG codec. I got the MPEG codec with the last d e v e l o p and didn't realise that it was not release software. BTW, I think that you mean MoviePlayer not Apple Video Player.

Hurm, I thought the MPEG codec was released. In any case it has been in
beta status long enough that if it is not out already it should be very,
very soon now.

I believe QT 2.5 has had the hooks all along to support MPEG, it's just
that they needed more time to finish up MPEG and didn't want to hold up
the release of 2.5.

Erm, try $2050 from MacMall, after $150 rebate.

(That's for the 16M RAM, 2.4G HD, 8x CD, 28.8 modem model. No, the
monitor isn't included in that price either.)

A better deal by far is the Power Computing PowerBase 200, at $1795 for
16/1.2/8xCD. It is essentially the same motherboard as the 6400, except
that Power Computing substituted an ATI 3D accelerator video chip for
Apple's video chip, and it has 2MB EDO RAM for video. It is also
available at 180 MHz ($1495) and 240 MHz ($2195). Add $100 to any of them
to get the mini-tower case instead of desktop.

There is also a Motorola StarMax 200 MHz 603e, 16M/1.2G/1M vid/8xCD at
$2K. SuperMac has the C600 (200 MHz 603e, 16M/2.1G/?vid/8xCD) at $1895.
I believe both of these are based off a Motorola motherboard.

With three major clone lines, Apple is defintely no longer the only
company to think about when buying a Mac. When CHRP finally gets rolling,
things should get really good.

Why must you insist on correcting every statment I make concerning
Apple. I do infact mean Apple Video Player. It is on my 840AV now
as I type this. If you don't know what is available, don't say it
dosen't exist. Now you can be sorry for that as well.
As for the MPEG codec, why include something that none of the
product line will be able to utilize because of the O/S overhead?
Even with custom codecs, MPEG on the Mac is extreamly slow.

Touchy here.. Everything I say is false? Care to back that up...The prices I
quoted are accurate unless you live in Canada..

I can dig up and post an Apple press release here.. Don't temp me.. Plus the
retailers and catalogs list the prices I posted..

Well, he was correct, you know. You can't really blame him for correcting
you when you are in fact wrong. And it was a much milder correction than
he could have chosen to make, given your confrontational manner.

> I do infact mean Apple Video Player. It is on my 840AV now
>as I type this.

Apple Video Player is an application which displays your 840AV's NTSC/PAL
video digitizer output in a window. It doesn't play QuickTime movies at
all; it doesn't even have an Open command in the File menu! You use it to
view analog video from a VCR or camera. (You should also have a program,
which I forget the name of since it's been a while since I had my 660AV,
which captures the digitized video into a QuickTime movie.)

MoviePlayer is the QuickTime player program supplied by Apple.

> If you don't know what is available, don't say it
>dosen't exist. Now you can be sorry for that as well.

Brian did not say that Apple Video Player does not exist. He said that
you probably meant MoviePlayer instead, which apparently was giving you
more credit for Mac knowledge than you deserved.

>As for the MPEG codec, why include something that none of the
>product line will be able to utilize because of the O/S overhead?
>Even with custom codecs, MPEG on the Mac is extreamly slow.

Define "extreamly [sp] slow". Do you expect your 840AV to decode fullscreen MPEGs even close to realtime? That's a laugh. It's only a 40 MHz 040. Haven't had much experience with MPEG on any platform, have you?

Think of MPEG playback as being like decoding a JPEG picture each frame, except that you must crunch together data from several past frames and perhaps even some future frames as well as expanding the current frame. There is a good reason why people who need to work with MPEG at all buy MPEG coprocessor boards.

(The only announced general purpose CPU capable of realtime MPEG *encoding* is the DEC Alpha 21264, the next-generation Alpha, which will debut at 500 MHz. Think about that.)

BTW, any Atari dealers in R/C? I never found one after Ridgecrest Computer Center shut down.

Nope..The 6400/200 is $2199 and or $2049 with printer rebate..

If thats to much power for ya, the $1499 6360/160 with 28k modem to boot..

Only if you allow it.. Macs ship from 16-32 megs. The memory is not an issue. You should worry about the Hades/Direct pricing.. Not even sold with enough base memory..

Why? Do you have a problem with the practise of enterprise and the free
market economy in the USA?

If someone has taken the risk of purchasing all these pads to make them
available to the internet community as opposed to the small population
around that shop, then I can only applaud their actions.

Please list this $3500 model.. I paid $899 for mine which was a steal at the
time..

Speaking of price..I logged onto Computer Directs home page.. My jaw dropped
when I saw the prices on the 040/060 Hades..

$2499 for an 040 box with four megs ram and 850 meg HD..

$2999 for an 060 box with four megs ram and 850 meg HD..

Who actually would buy such yesterdays technology?

Price does not include monitor. For that kind of money, they should take you
out to dinner to celebrate your accession to antiquated 040/060 platform..

Forget what? The last 601 Mac will be phased out in January and the top speed is 120mhz.. Apple no longer makes 603e/ 100-120 mhz desktop Macs. The min speed is 160 mhz...
>
> I didn't think it was appropriate to compare different speed chips
> when taliking about chip power, a 117 Mhz 603e in a Powerbook (I
> believe that exists) is not even close to the speed of a 120 Mhz 601
> according to the magazines I read and the people that I spoke to and I
> wouldn't call that blowing the 601 away.

Why not? Comparing PowerBook speed to desktop ones is like comparing apples and oranges.. PowerBooks tend to have a slower archetecture than their desktop ones due to bus and video speed..

A 160 mhz PPC 603e exceeds a 120 mhz 601..

And they're not speed demons either! A 200 mhz 603e is only 12 0.000000aster than
a 120 mhz 604!!! (and it only does 3 instructions per clock cycle)

>Why not? Comparing PowerBook speed to desktop ones is like comparing apples
>and oranges.. PowerBooks tend to have a slower archetecture than their desktop
>ones due to bus and video speed..

SO compare a 200 mhz 603e to a 120 mhz 604!!! The new 6400 is $2800.00,
and can't even do serious image editing! Stock, only 16-Bit color, and
VRAM is only 1 meg. (NON-UPGRADEABLE!) This limits you to only 256 hues
of a color at one time, unless you want to spend more money on a PCI
card! (Oh, the monitor is -not- included in that $2800 price either!)

I know of a much more honest way to share the wealth... GET A
JOB!!! Sure you will end up paying some money to the
government, but look at all the wonderful services you get in
return!! And you will feel much better about yourself because
you won't be stuck behind a computer posting to 200 newsgroups!
You may even make a friend or 2!

As for an article changing your life... try giving a read to
the following -
http://www.gospelcom.net/rbc/salvation/index.html

It will take you a lot further and doesn't cost you $5.00

Between a 120-150mhz PPC604. Depends on other issues like video, cache and HD speed..

>
> SO compare a 200 mhz 603e to a 120 mhz 604!!! The new 6400 is $2800.00,
> and can't even do serious image editing! Stock, only 16-Bit color, and

Here we go again with misleading info. The 6400/200 is $2199 as of last month. The 6400/200 with the Avid Cinema board installed with 32 megs ram is $2699.

The 6400/180 is $1899...

You should be concerned with Direct/Hades 040/060 pricing. The base price is $2499/$2999 for a 4 meg/850 meg HD conf and does not include pricing.. If you look hard enough, there are a few 040 Quadra 950's around for $1000 new..

> (And no, it isn't me!! :-)

Had the place that sells the controlers for $2.50 only sells in bulk for other businesses to sell to customers, then that's ok.

But this is a retailer that sells to the public, meaning it was ment for the public buyer. But if dealers will buy out stock from another dealer and sell for a higher price, then what's the consumer to do? If the price were barely higher then that wouldn't bother me, $5 would be fine. But for a ridiculous price that's way out of line, forget it! Then it'll be the same as ticket scalping.

BTW, I'm wondering if anyone with a ST computer still would buy a Jag controler with a good reason. I had an idea for a driver to use Jag pads in games that look for a joystick, but with the way the Atari scene is...looks awful bleak :P

NuBus Adapter card for a 6100/60
Date:
26 Nov 1996 22:33:17 GMT
From:
"" <xxxx@xxxxx.xxx>
Organization:

Newsgroups:
comp.sys.mac.hardware

I have a 6100/60 and when trying to connect it to a network, I had to
buy a
NuBus Adapter card. I was shocked to find out that apple no longer
makes
the card. They have them, but they are $500.00 Which I think is INSANE.
The
Nubus card itself was only $250.00. Is there anyone who knows where I
can
get a NuBus Adapter card for a 6100/60.
For less than 500.00
****
Only the names were changed to protect the swindled.

Mike

So what is a Amiga user doing in this group talking about Apex Media? :-)
BTW. Apex Media will look like Degas Elite compared to Apex 3. I have seen
it, I know! :

You forgot to mention (what are you, senile?) that it still only comes
with 1 meg of VRAM, and that to upgrade it you have to buy a PCI card,
and it DOES NOT INCLUDE the monitor!

ROFL!! Nice try..

The 6100 line comes with ethernet installed, you know a standard feature that
is an extra/option on the overpriced TOS line..

I don't know where this person comes up with $500 for a Nubus card. Does this
price include a ethernet as well. Still the most he would pay for a Nubus plus
ethernet is $200. However, the Nubus adaptor can be had for $49 from Shrieve
Systems and is on my price list...

If your not happy with the video, than you should get a PowerComputing PowerBase 180 which comes with the new ATI video chip and 2MB vram for $1499! My bro has one on order..

> I'm quoting directly from the latest issue of the Computer Shopper. AND it
> still does not include a monitor...does any of yours???

Why don't you quote from the inserts in your Sunday paper from the likes of CompUSA and Best Buy...

The Computer Shopper recieves those adds months before publication and are dated. Apple reduced the price in the third week of October..

> Thats a fair price for the performance that you would get from a machine
> with their specs. running TOS! BTW, why in the world would I want to step
> down to a Quadra????? (no matter what the price!)

ROFL again.. What denial! There is nothing efficient about TOS. If TOS has the functionality and features, of course you could brag, but you can't..

Those prices are obscene...

>
>Why not? Comparing PowerBook speed to desktop ones is like comparing apples
>and oranges..

If a desktop machine existed then I would have compared those machines
and I expect the 601 would be faster than the 603e when both are at similar
clock speeds, but as you say, apple have handicapped the 603e machines
so the comparisons are not fair.

>PowerBooks tend to have a slower archetecture than their desktop
>ones due to bus and video speed..
>
>A 160 mhz PPC 603e exceeds a 120 mhz 601..

Can you not see that when comparing chip power it is only sensible to
compare them at similar speeds?

For most, I meg is fine..However, you have choices.. Try the PowerComputing PowerBase 180 for $1499..Includes the new ATI 2/3d chip with 2meg VRAM..

Still cheaper than a 040 HAdes/Direct by at least a grand..

The TOS machines DO NOT INCLUDE A MONITOR!

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I'm not the only one that thinks that way either. It wasn't just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can't be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I'm 26 now and many of the things I'm telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say "You can do it... It'll be okay." I've never been able to make a good attempt at trying to repay her for all she's done for me and I'm not alone. Many people just have taken for granted the things she's done for them.

I know by now you're asking yourself why I've posted this letter. Well, to be honest and straight with you it's because I would like your help. If there's one thing that I've learned from Wendy it's that, "We are our neighbors keepers." You know the golden rule, "Do onto others as you would have them do onto you." Anyway now Wendy is an older lady that is disabled and can't do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can't be of much help. With no real family I'd like to do something to try to repay all she done for me and many others.

That's were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it's someone you can't even remember or have lost touch with. For that moment picture Wendy and say, "I'd like to repay that kindness." I wish you would sit down and write a small note saying "Thanks for being the generous person that you have been!" If you could include something to help out. Maybe it's a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin sends his love. Her birthday is next month on the 27th and I'm hoping

I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

Wendy Mcghee
9636 Elm
Taylor, Mi 48180

>Please tell me... how is this machine suited for HD-recording and MIDI?
>
>Yours, Jostein!

The Falcon has MIDI and DSP integrated into the design, it is not an add on. It is suited for this purpose right out of the box and many Gold records have been produced on Falcon technology.

This is not really the right newsgroup to ask this question. You are apt to get flames from users like Peter Sinclair-Day whose only goal in life is to entice people to entertain him with stupid feeble arguments.

The best place to find out about the power and functionality of this machine is in comp.sys.atari.st

All the best,

Chris @ Computer Direct

Simple, from where I learned of this (on the 'net) they did sell all over the country via catalog.

What we apparently have here is someone who is not just interested in taking a risk, for that they could have bought 100-200 or so. Instead, they bought up the whole stock. Doing so for the express purpose of shutting everyone else out so they can demand their own price.

It would have been pointless to purchase a couple of hundred if others
were still being sold at $2.50.

>up the whole stock. Doing so for the express purpose of shutting everyone
>else out so they can demand their own price.

If this were food, then clearly there would be a problem. But it is
only a game controller. Here's to the free market economy and the
American way of life.

Yes, its true, while there's nothing really wrong with buying up the stock,
it does irritate me. Ah well, I just know they will turn up eventually, I
just wonder who...

I'm not doubting you, but can you name some that have been produced
using Falcon digital audio (as opposed to just using it as a plain
sequencer)?

We're using an Atari for our current recording project, but it's just an
ST as we are using tape (analogue and ADAT) for the audio recording.

>ago.. The last update was probably 7-8 years ago..

This is about the 4th time you have brought up this null argument. It
is NOT updates that count it is the quality of the program itself, I
know you would prefer it if a program took 10 years and as many
versions to reach perfection rather than being released as a final,
finished and polished product straight away. I won't be stupid enough
to argue that Degas or Neochrome are particularly powerfull tools,
they are very old and by todays standards very simple. However another
thing that you don't seem to understand is that people use programs
that do what they need them to do, most Atari users aren't stupid
enough to buy the most powerful program on the market when the far
simpler and cheaper one does exactly what they need it to do.

>Those prices are obscene...

What denial! TOS is incredibly efficient, see a Hades or a Medusa and
then tell us we are in denial, the fact is that you are not in
possesion of any of the facts, you are claiming that we are lying
about a machines power and you've never seen one. You can't tell power
from raw specs, you should know that the OS counts for a hell of a lot
and you can only compare machine specs when everything else is the
same eg the OS. Features have very little to do with efficiency, my
typing might be shit but I can read and write English and I'll give
crdit where credit is due, you make a good point and I will aknowledge
it, that is no problem. The thing is that you can't make a good point
because you are fighting blind, you know nothing about the opposition.

True..Much of the Pentiums in the retail do not include a monitor. TOS machines do not include a modem and CD-Rom...

Apple's current PowerMac label line do not include a keyboard and monitor. This line is target for those who want customization. However, keyboards will be added as standard in the Q1/97 for all.

I've got the directors cut and am not sure about the 'lesser' version, but in the directors cut the scene is the one where Deckard (Harrison Ford) chases the replicant Zhora after she polaxes him in the niteclub artists' changing room. There is a shot of a shop front as he searches for her along the street, and the shop is selling -you guessed it!!- Atari. The next shot is shortly afterwards where Deckard hesitates as he climbs down from a small step. As he begins to move away you can see the Atari logo filling the backdrop.

I purchased a Pro-Logic system just to enjoy watching the Atari logo in Blade Runner and Terminator 2 BTW!!! :)

This is a bizarre assertion, considering that Atari itself never had any special monitor/system bundles. That I can remember, anyhow. It was up to the dealers to include a monitor. Same way with most Macs; the monitor and keyboard are not included in the base system price because the idea is that you get to CHOOSE which ones you want.

The inclusion of keyboard with Ataris was solely due to the fact that you didn't have any options on most of the Atari hardware ever sold; even on the machines which had a detachable keyboard there were no non-Atari keyboards available. Which led to such things as spring and even keyswitch replacement kits for Atari's keyboards, since they were so crummy. And expensive adapters to allow you to use IBM keyboards. And so on.

>Only if you allow it.. Macs ship from 16-32 megs.

Most Macs in the UK ship with 16MB, or even less. My 20MB Mac is not
man enough to load Corel Draw 6 without turning on Virtual Memory.
To upgrade the RAM further, I can't just plug in another SIMM, as
it only has one socket. So I have to go to the hassle of taking out
the old SIMM and trying to sell it. Of all the things you can say
about the Mac "memory isn't an issue" is not one of them.

If you care to read the title you will see this is about Falcons but
never mind. If someone pays $3000 for a Hades to use as a graphics
machine then of course it is unlikely to do anything close to what they
need. If they use it to run a huge database or something then they
decide they need a few quick pictures of a cartoon dog or whatever
then Neochrome will suffice. The point is, it depends.

There was a short interview in EQ magazine a few months ago with a producer who claimed the Falcon/Cubase Audio were his 'secret weapons.' I don't remember his name. I also read about someone who produced a game and short movie soundtrack using CAF. I don't know of any 'gold' record selling artists, but people are using it for serious tasks, right now.

He he he.. Plus you need expensive TOS hardware to go with that.. Don't forget the DSP board will cost an arm and a leg.. What ever happen to 'Power with out the Price" The new moto should be "Pay more for less"

'Yawn'

Who is crushing whom? Wintel has always had a bigger pie over the last decade.
Guess what, Apple is still here and the Mac OS clone firms are thriving..

> You've got all of your priorities screwed up. The Atari/Apple rivalry

Thats interesting...How so that Apple is dying? You have been saying that for
years.. I don't see any painful and terminal death..

I suggest you go down to the news stand and buy the Feb 16 issue of Forbes and
get a CLUE! It's the one with Amelio on the cover..

I trust Forbes over your track record..

Looks like you need a new Draw app. MacWeek panned Corel Draw.. Get Mac
Draw..

I suggest you forget about a new memory simm and get Ram Doubler II..Will sove
your memory blues..

There WERE available to everyone on the internet... maybe that's the
point that's being missed here. You could have ordered one yourself
for $2.50 (there was NO minimum order) or 10 or more at $2.00 each.
Now you can only get them for the jacked up rate...

Free market works two ways, and if the price is jacked up too much,
the approrpriate response is to not buy them.

Considering that my original 520STm (no f) is still banging away quite
nicely, I've never really gotten the point of all of this keyboard
bashing wrt the ST. Aesthetic quarrels aside, ST keyboards are quite
reliable and not quite so overpriced as they appear.

Hardly bizarre, certainly not in Australia, anyway. St's were virtually never
quoted without monitors. TT's and Falcons were, because using standard VGA's
etc. is an option.

<mgrove@ridgecrest.ca.us> wrote:

>Opps, isn't Ram Doubler an application that fixes the fragmented memory
>problems of Macs and utilizes wierd memory locations?

No. It's a replacement for the MacOS virtual memory system (and that's
really all it is). Unlike the built-in VM, it does not need to create a
swapfile which is the total size of the virtual address space; it grows
its swapfile as needed. In order to avoid too much disk activity, it sets
aside a RAM buffer where evicted pages are stored in a compressed form.
This makes it significantly faster than Apple's VM as long as you don't
really overload it (which forces it to go to disk). In general it is
faster than Apple VM.

>Is there a FAQ to tell me which version of Ram Doubler to use with
>the version of the Mac O/S I decide to install?

Easy: install the latest version of RAM Doubler. Period. I don't think
any of the versions are specific to a MacOS version; they just generally
require some form of System 7 (it may be that 7.1 or later is required, I
don't remember).

>Can I run three or four versions of Ram Doubler at one time to
>be compatible with software that only supports certian versions of
>Ram Doubler?

No, of course not. Fortunately, that isn't really necessary either.

>If I rename Ram Doubler to Doubler Doubler will I get twice the Ram?

No. But if you hack into it and change the multiplier variable to 6 you
will get a virtual address space six times the size of your physical RAM.
And if you get RAM Doubler 2.0, you can change between 1x, 1.5x, 2x, 2.5x,
and 3x with its control panel. The choice to call the thing RAM Doubler
and limit it to multiples of physical memory is pretty much a marketing
decision; your VM space can be as large as 2GB (which is the MacOS limit
if I recall correctly).

Heh. It's basically a direct connection to the 68040 (or 601 in the case of the 6100) memory bus. The adapter card, in both cases, contains a NuBus controller and a NuBus connector. Not putting the controller on the low-cost machines was a cost savings; I guess Apple figured that the target market traditionally didn't care about expansion cards.

$125 probably wasn't a bad price for the things either. NuBus controllers are expensive for some reason, which is part of the reason Apple switched to PCI. (The other part is of course that PCI kicks butt on NuBus in the speed category. :)

Which type of Macintosh do you have? I didn't know that any of the
PowerMacs had only one SIMM slot. Also, and I'm not trying to refute
your claim, why are you using CorelDraw? It is one of the worst
illustration programs that I have ever encountered.

You just don't get it, do you? You waste your time over here bashing
Atari computers and making a big deal of the Atari/Apple rivalry, when
your real enemy (Microsoft and Windows) is crushing you.

You've got all of your priorities screwed up. The Atari/Apple rivalry
is a dead horse! Better that you go over to the Apple/Windows/PC advocacy
groups and fight for Apple which is dying a painful death at their hands.

Or you can go ahead and continue to waste your time here. I'll just keep
on laughing.

I think that most people would be complaining about the ergonomics of the
Atari keyboards. They aren't curved and there is not wrist support. I
think that buying the keyboard seperately is a better idea because you
can get the one that you want.

Yea, just like the MacPro Plus keyboard that I am using like many other
Mac users. Of course lets not get into the discussion of what a Mac
keyboard
cost, we Atarians suffer the same problem.
The Falcon keyboards are pretty nice, at least compairing it to the old
1040ST I have. But the MegaSTE keyboard on my C-Lab cased Falcon is
nicer
than most all but the most current and most expensive keyboards
available
for most other platforms, mostly at this time, most of the time.
So for the most part, I am mostly happy with the MegaSTE keyboard. Most
of the time it is connected to my Falcon, but sometimes (when it isn't
mostly) I connect a PC keyboard to my Falcon in a tower with a Keyboard
Gizzmo, mostly, but sometime with the Decca from Wizztronics, which most
of the time is available from Toad.

Opps, isn't Ram Doubler an application that fixes the fragmented memory
problems of Macs and utilizes wierd memory locations?
Is there a FAQ to tell me which version of Ram Doubler to use with
the version of the Mac O/S I decide to install?
Can I run three or four versions of Ram Doubler at one time to
be compatible with software that only supports certian versions of
Ram Doubler?
If I rename Ram Doubler to Doubler Doubler will I get twice the Ram?

Yes. Why the "opps" (sic)? Are you suggesting that I may have claimed that
the MacOS has good memory handling? I never did.

No-one in their right mind (this excludes Petey, of course) would claim the
MacOS RAM handling is anything other than cack.

They have them, but they are $500.00 Which I think is INSANE. The Nubus card itself was only $250.00. Is there anyone who knows where I can get a NuBus Adapter card for a 6100/60. For less than 500.00

I had a 660AV at work that required the same card. I bought the card NEW for $125 I believe. For some reason, Apple decided to use a different type of slot in these machines (not PCI either).

Now that I don't need the adapter anymore, maybe I'll sell it to some poor sucker and make some extra money.. :)

The "Opps" was for the other poster. I felt that he was implying
that Ram Doubler was a "Virtual" memory only solution. If I'm
not mistaken it does a little more than that.
For once I didn't attack what you said :)

>
> No-one in their right mind (this excludes Petey, of course) would claim the

I've tried to understand all the adds for Ram Doubler and such,
but I just stuck in a couple of 32's in the 840AV and didn't
mess with any of it. Still, even with 7.5.5 I end up with
out of memory problems everynow and then. I can't image a
50meg frag between applications:). Aside from Quick
Mail I use both Macs for video grabbing and MagiC Mac, which
both require all types of memory management utilites to be
switched off. At least with the Mac I've went from waste not
want not to, filler up with premium.

You couldn't tell it by retail presence. Mac Clones are nowhere to
be found (unless you're already a dedicated mac worshipper) while
what Macs can be found by the non-converted are out of date collecting
dust in the back corner.

At least the cloner (& cloner mail order) vendors actually manage to
make their presence known to the masses. We could tell them that Apple
is already dead and they would never be able to tell the difference.

Virtually NO keyboard provides its own wrist support. The ones you're harking about require the same $5 solution that would work just as well with an ST keyboard. Then there are your beloved curved keyboard: which only works if you happen to conform physically to the maker's preconcieved notions. In this respect they are no better ergonomically than a straight keyboard.

It's a shame that Apple's hinged design didn't catch on. The M$ natural and it's feelalikes are really rather shallow immitations...

>> think that buying the keyboard seperately is a better idea because you
>> can get the one that you want.

This is just an excuse to deal with the fact that Apple tends to neglect necessary components in it's rather overpriced systems.

I am looking for an old basic program from the 1980,s that I found in a mag.
It is a Lie Detector program that used the old game paddles. If anyone has, or knows where i can get a copy of this program please let me know.

Thank You
Samsams aol

I agree with that, the ST/Falcon series keyboards may be long lasting,
but don't have the "touch". The MEGA/TT keyboards are a way better,
but I still prefer PC keyboard, unfortunately the interfaces are quite
expensive compared to the price of a keyboard :-/

Take Care, Miika

They would laugh in YOUR face. All the things that they would
likely see would indicate to them that you are sadly dellusional.
There is nothing in the public eye to indicate to anyone, except
those who already have an irrational devotion to apple, that apple
is not in decline.

Learn to read sometime. I was not talking of preaching to the choir.

Your actions quite reflect the nature of Apple's marketing incompetence.
You go to great efforts to antagonise the group most likely to resist
the great hype and fail at any opportunity to show how your beloved
machine would better serve than a 10 year old orphan.

Childish posturing devoid of relevant details is all you are capable of.

You are a pathetic advocate.

Their thruput, which you deny much like a frightened little child
clinging to it's pillow after a nightmare, would indicate otherwise.
Perhaps what is needed is a version of TOS for PPC that completely
tosses the MacOS. Then perhaps, full utilization of it's hardware
would be attained...

6599. Why Atari?

Newsgroup: comp.sys.atari.advocacy
Date: 1996-12-04 00:00:00 UTC
From: Thomas Main <main@conrad.appstate.edu>
Message-ID: <Pine.PMDF.3.95.961204164352.576723512A-100000@conrad.appstate.edu>
Source record: 7458

I have been using Atari products for many years. When I was a teenager, a friend had an Atari 800 and I was very impressed with it. I also got an Atari 800 and learned to program a bit on it, played some games, typed in programs, etc. I lost interest in computers for a few years after that. Once I was in college, I started writing a lot and was using an Apple IIe with AppleWorks as my writing tool. I remembered using an Atari several years earlier and looked into getting one again. I would up getting a 130XE with disk drive and Atari Writer Plus and was pleased with the performance, even though I only had 40 columns in my word processor.

Sometime later I found out Atari was still making computers and I bought a used 520ST. I was amazed with the usefulness of the machine. I loved using NeoChrome to draw pictures (an application I hadn't really tried with a computer before). I also started to delve into a little BASIC programming and was very satisfied with the machine. I upgraded to a 1040STe later to run Calamus. I liked Calamus a lot and used it to produce all kind of things at work from bookmarks to flyers to invitations, etc. I then went to an Atari show and bought a Falcon. In the two years I had this machine I started writing reviews of software, using a lot of PD and enjoyed the graphic applications of the machine.

I also bought a Jaguar when it came out (not that I was a big video game player - actually I never had played video games all that much). I was impressed with the system, though, and hoped it would be a sucess.

I also became very disillusioned with Atari - always having to reboot my computer after a crash, no support from Atari Corp., not being taken seriously as a computer enthusiast by others, etc.

So, after hanging in there with Atari for many years, I got rid of all my Atari stuff. I felt good about it, making a clean slate.

I bought a Windows compatible machine and later upgraded it and started using Win95. Mostly, I use this system for Netscape and other internet applications. I works nicely and I am pleased with it.

However, a nagging memory of Atari stuff still haunted me and I have started re-accumulating a lot of Atari stuff. This time around it feels different because I KNOW the platform is dead and I feel I can really enjoy it. I got an 800XL and am having more fun with it than I could ever imagine having with an 8-bit system - learning more about programming too! I got a Jaguar again because they are really cheap to buy now and I use it to play a game on occasion without worrying whether it's really "64-bit". I have GEMulator on my PC which I can tolerate but don't really like. I'm hoping to get a used Falcon system sometime in the next year.

Has anyone else had this sort of fascination-rejection-and renewal of interest with Atari products? Why do we continue to use/enjoy Atari products? Speaking for myself and just for this week I enjoy Atari because of Iron Soldier on the Jaguar and Music Composer on the Atari 8-bit. Microsoft asks "Where do you want to go today?" Maybe I should say, "Where you yesterday and would you like to go back today."

There's a difference between being quoted with a monitor and being
bundled. Was Atari Australia bundling monitors with STs, or were the
dealers doing it? I am fairly certain that US Ataris were never sold *by
Atari* with a particular monitor bundled.

Macs are not bundled with a monitor by Apple. Dealers don't usually quote
prices with monitors, but I suspect that is mostly because there are a lot
of possible choices for the customer to make. Monitor buying these days
is a matter of figuring out how much money you're willing to pay for size
and quality.

When I have tried MagiCMac so far, it doesn't work with virtual memory, period. Apple's VM or RAM Doubler, it makes no difference. I have seen announcements about the upcoming version which say it is now compatible with VM.

It's memory fragmentation. Something any OS suffers from if it is not running VM of some kind. MacOS tends to suffer more because its memory allocation system was designed to let a fairly complex GUI run on a 128K machine; it hasn't aged real well.

>>So you need a Mac to get the job done..Can't the Hades/Direct handle it?
>
> Betcha the Hades/DirecT won't give you out of memory errors with half
> that amount of ram, let alone 64 megs!!!

Sure will. Easy way to do it: run program A that uses 31 MB, run program B that uses 60K, quit program A, run program C that wants 40 MB. On a 64M machine with no VM there will be an out of memory error, because after quitting A there is no free block which is 40 MB. Doesn't matter what OS you are using either.

This is why I run RAM Doubler, even though I have a 64 MB Mac. It gives me a VM system, which eliminates memory fragmentation problems. I could use Apple's VM, but that would require a 65 MB VM file to sit around on my disk all the time, and Apple's is slower than RD anyway.

The NTSC machines didn't need a monitor, they could be connected to a
video
monitor :) (RF or Composite).

As far as Mac's go, get a used 840AV. They run at 40mhz and MagiC
runs quite nicely at that speed on an 040 (more than can be said for
Mac O/S). "Refrbished" ones go for about $1000.00 U.S. MagicC is nice
for Calamus or for that matter most any DTP or WP for TOS, ImageCopy
works great, as does Photoline, GT Look, Kandisky, Lattice C 5.6 and
DEV Pac ect..... Plus you get s-video input with the Mac. With NVDI
you can go up to 800*600 24bit color. Runs like a fast TT with a
graphics
card. According to Gembench, MagiC runs as fast as a Medusa (I think
the reference is to a Medusa 040).

Earlier versions claimed to work with VM (but not RAM Doubler).
The PPC version does NOT run with VM, as it hogs the mmu itself.
I don't know about current 030/040 versions.

I can't agree with this recommendation. I would suggest getting a PowerMac.
Depending on which model you get, it can be slower or faster than
the 840 at running MagiCMac programs, but you are likely to migrate
fairly quickly to native Mac programs, in which case the PPC gives a BIG
performance boost. It only took me a year to migrate all my work from
Atari s/w running under MagiCMac to native PPC software running fast
on the PowerMac.

If you never go native, then the 840 is a good bet. But when you realise
what Mac s/w is out there...

For a new machine, you might look at the Performa 6360, or one of the
clone machines in its price range ($1500). At that price level you can
get a 160 to 180 MHz 603e, some form of video input (actually that may
cost extra, I haven't looked at the pricing in detail), and some PCI slots
(probably more of them on a Power Computing machine than a Perf. 6360).
Add Speed Doubler and the machine is guaranteed to exceed the 840AV's
680x0 performance by a factor of 2 (at least), except for FP programs.

I'm not saying this is wrong-but I have a problem with it. I can run
several different Euro-style demos (which as anyone familiar with this
type of coding can attest to) which use almost all of my Falcon's 4 megs
of Ram...I can quit out of one and goto another without having to reboot
or getting "out of memory" errors...I assumed this was good programming,
simply having the exiting program let the system know that the memory
was once again available...

Paul@pwomar.demon.co.uk (Paul Womar) writes:
>into it, it depends on how stable MagicMac is really, i'm looking for
>someone who has used it, anyone?
It's fairly stable. DA's Vektor was the big one to give me problems,
but it's a very buggy program at the best of times.

A few of the things I ran successfully with MMac include Calamus SL,
PageStream, ImageCopy, GemView, ConNect demo (040 only, doesn't
like my PPC), Emacs, Lattice C, Papyrus, DA's Picture, things I'd
written myself...

The VT52 emulator is cack, so text-based programs don't run very well.

As time went on, I found better Mac-native equivalents of the above programs,
and only use MagiCMac for one thing; accessing CIX via the CixComm/CixRead
programs. Now that I've got SoftWindows 95 on the way, even that use
will disappear.

Not necessarily, it depends on the memory model. I could turn off
VM on OS/2 and segmentation was not a problem, as you don't have all
programs sharing a single logical address space.

Can someone explain one aspect of the PowerMac VM to me please?
A Get Info on an application typically says something like "minimum
memory requirement reduced by 1300K if running with VM on".

Actually, it's GEM you moron. TOS is GEM + GEMDOS for the ST.

Well, this hack provided a filesystem, virtual devices, virtual
device api's, a windowing system, a windowing manager, a desktop
shell & a primitive scheduler all in 200K and did it in such a
fashion as to be trivial to port and easy to augment.

This trumps MacOS by quite a bit.

>
>TOS has no were the functionality, features and technology that is tied to the
>Mac OS.

The IDEA is tied to Xerox PARC, actually. It is an idea, not actual
technology that X, Digital Research or MicroSlop 'may' have swiped.

However, Apple's intent to assimilate BeOS is actual copying of
technology.

Despite Apple somehow being capable of generating their own unique
intellectual property or despite MacOS being somehow superior (to
anything), Apple must depend upon someone else's technology and
not just ideas or concepts in order to keep up with an orphan platform.
Apple must do this despite all of it's admittedly superior resources.

It is truely sad when the OS offerings from an orphan can compete
with a giant like MicroSlop and the OS offerings from another giant
cannot.

Your blind loyalty is a greater threat to Apple than MicroSloth and all
the PC vendors combined. You nullify what proper market forces might be
in place to coerce Apple to do what is required to compete in a larger

market. Now they have lost whatever advantage they may have had to mitigate their higher prices and less support.

Apple has gotten a free ride from the likes of you in the past and is now paying dearly for it.

Macs have no retail presence at this time. Without this, people will
begin to consider them dead. There is nothing in the public eye to
give people a good impression of Apple with the most recent visible
coverage being about Apple's imminent demise.

A few lines in more financially oriented publications will not counter
this. Then the general public will see the Mac's pathetic storefront
presence and jump to conclusions.

Mail order chain backorders wont help. Furthermore, those numbers are
rather meagre when compared to the rest of the market. This is the
market that Apple actually competes against and gets compared to. That
you can best a 10 year old orphan [in PR] is of no consequence.

[deletia]

The percentage of consumers that exist within that market really is
minscule. THAT is not the public eye. A price tag at a college store
(that is assuming that there is shelf space at the college store) where

no one may venture to is not even the college public eye let alone so
in general.

>
>
>> Learn to read sometime. I was not talking of preaching to the choir.
>
>
>Learn to get a clue and educate yourself..

All I need do is look around. Aptiva is visible as is Gateway 2000
without ANY effort to find them. Clones still haven't shown their
faces any where near the general public. I have yet to even encounter
print ads for them in publications one might expect a non-MacWorshiper
to read. Further that with the general lack of retail presence and you
have a grim picture.

It may not reflect reality but, it need not do so. That is the point
you cannot seem to grasp. An elitist attitude and the unwillingess to
proper PR wont get Apple anywhere.

The best you can come up with is educational pricing.

> was once again available...

You're running only one program at a time. When you quit it, all its
memory is freed up, as you say. However, if you have a multitasking
operating system, it is possible to get a program stuck in the middle of
memory. Run program A, run program B, quit program A, and you will have
fragmentation because B is still sitting in the middle of memory.

Ataris would have massive problems with this issue, except that most of
them don't run a multitasking OS. The model on Atari tends to be that you
run a single application program at a time, which takes up all available
RAM. Desk accessories are there, but they load during the boot and cannot
be quit, so they don't cause fragmentation.

VM completely bypasses this problem by virtualizing addresses. This means
that Program A might think it has an address space starting at address 0
and going to address X, but it is actually stored in a relatively random
jumble of physical addresses, which are not even necessarily in increasing
order. Memory is allocated in chunks, typically 4KB, referred to as
pages. The lower bits of a virtual address are the offset from the
beginning of a page, and the upper bits are the virtual page number. The
CPU automatically translates the virtual page number to a physical page
number, typically using a Translation Lookaside Buffer (TLB). (A TLB is a
cache which caches the systemwide page table, which is typically a
megabyte or two of RAM set aside to store all the virtual->physical
mappings.)

An operating system can change the virtual->physical page mappings so that pages can be moved wherever it wants in physical memory. And even if memory is horribly fragmented, the OS just chooses whichever pages are free to allocate to a program; as far as the program is concerned it has a linear and unbroken chunk of memory. Pages can be swapped out to disk, too: just set a bit in a page table entry which says it is not resident in RAM, and the OS will be called when an access to that page is attempted. The OS can then read the page back from the disk and restart the program which needed that page.

I'm not saying they were unreliable. I'm saying that, for myself at
least, the 1040STe keyboard felt like it had mush behind the keys instead
of springs. Personally, I like IBM (True Blue, not cloner) full click
keyboards, and almost everybody I've ever talked to doesn't really like to
type on a keyboard with no feel whatsoever. At least not if they are
touch-typists. (Hunt&peck typists seem to get on fine regardless, because
if you have to look at the keyboard you don't need the physical feedback
from the keys as much.)

Indeed? It's trivial to port and easy to augment because it implements very, very few services compared to the MacOS. GEMDOS is essentially a slightly cleaned up DOS (if you look at the calls, they're nearly identical). GEM is a very simplistic windowing system. It all fit in 200K because it did so little.

Actually, as far as size goes, System 1.0 for the Mac was probably more impressive. The Toolbox routines sat in 64K of ROM and the rest of the OS had to share 128K with application programs. And it had more features than TOS.

(That's not really surprising, considering that Apple had been working on the Macintosh System for several years, starting from a blank slate, while GEM/GEMDOS was essentially a bolt&go OS put together in very little time.)

Macs have never had much of a retail presence. Traditionally, mail-order
is where the bulk of Macintosh sales (hardware and software) take place.

That's not to say that the current problem with retail stores dropping
Macs doesn't disturb me. But it's not the kiss of death you make it out
to be.

Well, everyone, I am typing this from the keyboard of my new Performa PowerMac 6320, which I bought on close-out from Staples. As an Atari user, I have a number of observations about both platforms that I hope will quell much of the BS on the net:

Where Mac excels beyond TOS machines:

1) Multimedia (at least in this machine). I was able to record, edit, and playback video without a crash, or peep.

2) Application availablity. 'Nuff said.

3) General speed (surprise - a 120 MHz 603e is faster than a 16 MHz '030 (though it doesn't feel that way sometimes!).

Where TOS excels beyond Mac machines:

1) Stability. I have crashed this Mac more that five times as frequently as my Falcon030.

2) Multitasking. Even using DA's for multitasking, Falcon destroys MacOS. I attempted to run a simple Kermit transfer in the background from ClarisWorks while running the word processor from within Claris-Works. Heh, stopped that quick - characters were dropped and took several seconds to appear on the screen. On the Falcon, STalker and AtariWorks multitasked seamlessly in 4 megs under MultiTOS, without any delays at all!

Folks, choose your machine. And use it and enjoy it.

TOS is no more than a hack put together by the now defunct Digital Research..

TOS has no were the functionality, features and technology that is tied to the
Mac OS.

Give it up Jabba..

> A weak excuse at best...

Not a weak excuse at all. PowerComputing is backordered.. 50,000 reportedly for the PowerBase alone.. However, Power is shipping in quantity to stamp out that backlog.. Umax/SuperMac is doing well despite that their line has not reached all retailers yet. Motorola started producing their first 20,000 StarMax line. APS will start rolling out this week for their clients..

PowerComputing has done well for a two year company. Power will defantly break a billion in sales in '97'. Wonder why the Tramiels/Atari did not forsee this..

The only entity that is in decline is a lifeform called a Jabba...

Apple is getting their house in order.. Pricing is in line.. The Performa 6400 higher ed price is around $1500 as of today..

Apple does have marketing issues that need to be addressed. I have mentioned this before.

Considering that there are more than one Mac clone firms, Apple is not the only game in town.. Ain't competition grand? There should be competition to the Hades/Direct to drive those fanatsy prices down..

> If you never go native, then the 840 is a good bet. But when you realise
> what Mac s/w is out there...

And you will wish you never got started:) After adding a Mac
to my collection, I have been disapointed more times than not
with the quality and pricing of the available software and
hardware. You will really hate the Mac O/S after moving from
the Atari platform (especially if your using a Falcon).
The file system really sucks. Try editing in a directory
containing a couple thousand files, or renaming multiple
file names. Can't be easily done. Kobold handles this without
problem. Go to Walmart and try to purchase some Mac software on
a Friday night binge. Good luck.
There are a few that stand out, but for the most part I favor my
TOS applications. If you really want an inexpensive Atari clone and
want quality apps get a Pentium and stick an Gemulator inside if
all you want to do is run ST software. Quality software at
affordable prices, and inexpensive hardware upgrades are
the norm in the PC world. Windowns NT is nice, I haven't
played with Win 95, and you will find OS/2 will be more to
your liking switching from TOS. If you are currently using
a Falcon, you will miss the DSP software that won't run under
MagiC Mac, but if your looking to see Calamus or Photoline at
800*600 in 24bit go for the Quadra. Video memory for the
Quadra is only about $45.00 to go to two meg and is easily
installed at home. Uses 72 pinn standard simms (60ns) that
can be mixed and matched in whatever configuration.
You also get the ATT DSP which "some" Mac apps utilize
for quicker filtering, and maybe some sound app's make
use of it. For $999.00 its a steal. Don't be ripped off
about this powermac shit. The only reason these guys push

it is they remember how slow the Mac O/S is on an 040
Mac. Running MagiC Mac is a completely different story.
Like the difference in speed over a 1040ST and a TT.
On the Quadra 840AV, Phoenix (Xenomorph) will render
four time faster than my Falcon running from 32mb of Fast
at 32mhz/64mhz FPU. Screen redraws and general desktop
performance is quite impressive as well making the Mac
O/S look like something from running PC Ditto (software
version) on an 8mhz 1040ST.
Anyway I don't think he was asking for advice on which Mac
to purchase for the purpose to "migrate" over to PPC apps,
he ask which Mac would run MagiC Mac the best. By far the most
cost effective method is the Quadra 840AV. With a cheap clock
speeder, you might get up to 46mhz, easily keeping up with the
PPC's running MagiC Mac. You get the Mac onboard video. Which
PPC includes that for under a grand? The cheapest Mac clone
will run you $2200.00 for included video (DC20).

And I was just starting to like you, Brian.

Wrong! It clearly states in the MagiC Manual, in English,
that VM must be disabled. This has been true for both versions
that Toad has had imported to date.

Does the Hades run MagiC? The only reason for his question, I
think, was that he is looking for an inexpensive way to run TOS
applications. Utilizing MagiC Mac, he can have an 040 TOS
machine for less than anything else on the market. You would
expect to pay more for the performance increase you would see
with the Hades. But at least the option is there, one that allows
several O/S's on a single platform, performance compairable to
the newest machines on the market without having to reinvest
in all new software.
Personally I think that if he is to abandon his Atari machines
he should go with an Intel clone. So much more software and
hardware for soooooo much less money.
But if he is good at Christmas, I would ask for a Hades:)

Of course, you can't handle the truth when it was placed right
before you on national news. The left way is always deny everything no
matter the truth.

So Stevey, tell us the
> difference(Rush's view) bewtween the two..

First off, you'll have to ask Rush if you want his
views. Second, Rush happens to agree with me, not the other way around. I
unlike most liberals I know, can think for myself without the govermant
doing it for me. It is I and 84% of this nation(consevatives) that put
Rush where he is and not the other way. Liberals are always trying to say
Rush listeners are mindless. The fact is your just jealous because no one
likes or listens to liberals and this is why you have no voice in talk
radio, becuase all who have tried have failed, Penis. Why have they
failed? They have failed because liberalism is not at all a mainstream
idea. You just don't get it do you?

>
> Four more and 8 more for Gore, get over it..

Don't count on it to hard Penis. That is if you can count.

>
> When Ragun was in office, we got on with our lives..

Ragun was never in office. Reagan was however and you liberal
scum didn't let up for 12 years and now even with your prez, you still
aren't satisfied and still bitch about Reagan. You Commies wont be happy
until this country is a total socialist nation. Clinton wont effect me
because I know how to survive without the government unlike your self and
millions of liberals like you who feel it is the only hope. Such a pity.

A lot of my crashes happened because of conflicting software, especially
AUTO folder programs conflicting with each other/programs I was running.
I like the way Win95 can "recover" from a crash without having to reboot
the system versus the way the Atari locked up.

As to support from Atari
Corp., one example I want to point out is that when I bought my Falcon, I
bought TruePaint with it. The grid function didn't work properly and
after calling the distributor and trying various things, we discovered
that the problem occured only under TOS 4.02 and not 4.04. Since I had
just bought my Falcon and it was still under warantee, I asked to exchange
it for a model with TOS 4.04. Atari said "no can do." My dealer said
that "in a couple of months" Atari was going to release 4.04 as a chipset
that I could buy for around $60 + installation costs. I'm not sure
whether TOS 4.04 ever became available as a separate package you could
buy. Contrast this with Packard Bell - I bought a Win 3.1 computer from
them and later they sent me a free upgrade to Win95 because I had bought
my machine within the last 6 mos.

As to not being taken seriously by other computer enthusiasts - I'm sure
this is something that everyone who uses Atari has had to put up with from
time to time.

>
Well, yes, that is why I posted in an advocacy group :) But I'm not
really knocking Atari by calling it "dead." I know that there are some
really dedicated developers who are still working to produce some things
for the Atari and I congratulate them on their effort. I call Atari
"dead" now because I don't think that there is any chance of mass-market
acceptance of the platform. The Atari 8-bit is "dead" too, but there are
still some developers for it and many enthusiasts. Calling a platform
dead is not really an insult. (Of course, when Business Week put Apple's
logo on their cover with the headline "Death of an American Icon" I
thought that was insulting - and premature, somewhat like Mark Twain said,
"The reports of my death have been highly exagerrated.")

>
> >"64-bit". I have GEMulator on my PC which I can tolerate but don't really
>
> I only have the gemulator demo, but it works very well on my pc,
> tolerate?,
>
Well, GEMulator works well for an emulator, I guess. But it is not
anything like the real thing. I have noticed especially that in drawing
programs I do not have the control of the mouse that is needed (may be due
to a too slow PC). Also, after working with a Falcon, the speed, lack of
high resolution-color support, and lack of Falcon compatibility is VERY
noticeable. I also have a lot of file management control problems, like
trying to import text into Calamus, copying from floppies, etc. I would
much rather have a real Atari than the GEMulator.

As I said, if you cared to read it instead of just rudely shouting
"wrong", older versions worked with VM. If Toad (whoever they are)
have only imported two versions, then they clearly haven't imported
them all.

VM support was changed when the PPC-compatible version was produced.

<snip>

: Has anyone else had this sort of fascination-rejection-and renewal of
: interest with Atari products? Why do we continue to use/enjoy Atari
: products? Speaking for myself and just for this week I enjoy Atari
: because of Iron Soldier on the Jaguar and Music Composer on the Atari
: 8-bit. Microsoft asks "Where do you want to go today?" Maybe I should
: say, "Where you yesterday and would you like to go back today."

I can't say That I ever lost my facination with my first ever computer,
a 1040stfm. Having worked with PC's and seen a little of the apple and
commodore offerings of the day i decided that the one meg st was the
the pick of the bunch for my budget. I liked the midi interface, the
commercial and free/shareware software and the games..
I didn't like the mouse or the position of it's port but these irritation
were easily fixed. I hoped for a long working life
and to accumulate enough software before commercial support dried up
(as it always does for any given platform).

So now you know where I was yesterday and you know what,, I'm still there.
I'ts not so bad either. Second hand atari gear has to be fantastic value
I recently bought a one meg stfm, a one meg ste, a mono monitor, a colour
monitor, and a 30 meg hard disk and still had change from $400.
As for software.. just hang about here (on the internet) and you won't have
too many problems. I personally am waiting for the www package with ppp.
I can't use slip because my isp can't get it to work on his linux system!

I snipped your comment saying that atari was dead. True for the corporation
but the movement lives on especially in germany of all places.

It just like with cache...more is not necessarily better. I'll take TOS's
clean, hard 'n fast OS (especially the file ops) over any other OS on the
market anytime...everytime...! :)

FOR SALE: ATARI 1040 ST - SYSTEM AND SOFTWARE !!!
ATARI 800 - SYSTEM AND SOFTWARE !!! (Listed Below)

****
ATARI 1040 ST - SYSTEM AND SOFTWARE !!!
****

***** Best Offer ****** For Everything *****
(plus shipping costs)
Will sell components separately.

HARDWARE: Original boxes and documentation.

ATARI 1040 ST and ATARI SC-1224 COLOR MONITOR
ATARI SH-204 HARD DRIVE
ATARI SX-212 MODEM - 2400 Baud
SUPER CHARGER - TALON TECHNOLOGY (converts Atari to IBM format)
SF354 3-1/2" EXTERNAL FLOPPY DISK DRIVE
MASTER-5S 5-1/4" EXTERNAL FLOPPY DISK DRIVE
WIRELESS REMOTE CONTROL JOYSTICKS - (2 on 1 base)
(1) QUICKSHOT JOYSTICK (2) ATARI JOYSTICKS
* All hardware purchased in 1990. (except for 2 original style
joysticks)
* Original cost new in 1990 was $2,000+-

ATARI ST SOFTWARE: All original disks.
(All software believed to be in working order, but not guaranteed)

BOOT DISK ST LANGUAGE DISK
LANGUAGE DISK 1st - WORD
PROCOPY COPY II ST - Disk backup utility
PC/InterComm
SUPERCHARGER (images) ST Informer disks - 1291,192,392,492,592
REGIONAL COOKING COLLECTION AMERICAN COOKS CHINESE
ADDITIONAL PROGRAMS LOADED ON HARD DRIVE, HOWEVER NOT CATALOGED.

GAMES: (All in original boxes with instructions & 1 disk,
unless otherwise noted)

ARKNOID (instructions, no box)
DUNGEON MASTER (instructions, no box) -
(also comes with print outs of
maps and story)
MISSILE COMMAND (instructions, no box)
OBLITERATOR (instructions, no box)
(2 disks)
SUPER CYCLE (instructions, no box)

TIME AND MAGIK (instructions, no box)
The WRATH OF NIKADEMUS (instructions, no box) (2 disks)
WARLOCK (instructions, no box)
PRINCES IN AMBER (box, no instructions)
TIME BANDIT (box, no instructions)
XEVIOUS (no box, no instructions)
TEMPLE OF APSHAI TRILOGY (no box, no instructions)
ADVANCED DUNGEON & DRAGONS - HEROES OF THE LANCE
(no box, no instructions)
(3 disks)
ADVANCED DUNGEONS & DRAGONS - HILLSFAR (2 disks)
BARBARIAN S.D.I | The BLACK CALDRON (2 disks)
BLOOD MONEY | CHRONO QUEST (4 disks)
CRYSTAL CASTLES | DEATH BRINGER (3 disks)
DRAGON LORD | FOUNDATIONS WASTE (2 disks)
GATEWAY (2 disks) | GAUNTLET (2 disks)
GHOSTBUSTERS 2 | The GUILD OF THIEVES

You'd really take TOS over any other operating system on the market? Does
this include IRIX and BeOS?

Actually, Apple's Performa line of Mac's are bundled with monitors,
keyboards, modems, etc. The only exception to this I believe is the 6400.

Actually, you can pick up a brand new Performa 6400 for about $2000.00US. This is one very usable and capable machine.

Michael Grove <mgrove@ridgecrest.ca.us> writes:
>Wrong! It clearly states in the MagiC Manual, in English,
>that VM must be disabled. This has been true for both versions
>that Toad has had imported to date.

As I said, if you cared to read it instead of just rudely shouting "wrong", older versions worked with VM. If Toad (whoever they are) have only imported two versions, then they clearly haven't imported them all.

VM support was changed when the PPC-compatible version was produced.

Sorry, Wrong again! For the sake of not having to look-up every revision that Toad has imported (from the same place you buy your copy) I stated two revs. In fact it has been 4 or 5, I have forgotten the actual number. In anycase, the first release of MCM, in the U.S, from System Solutions, imported by Toad Computers, inside the manual it states to disable VM on the Mac as it does not work (both with MCM and the Mac O/S:). This is the version prior to PPC support. So if this version is prior to PPC support, and your stating that it wasn't changed until the PPC was available, then your statement is false. If I could have possibly misunderstood what you stated, please try again.

Mike

Well I'm not going to abandon it, I'm going to keep my ST still for a
while and just gradually move across, and its going to take a loooong
time before something can replcae Tempus. And there is no way that
I'mm move to a Wintel machine by choice.

>So much more software and
>hardware for soooooo much less money.
>But if he is good at Christmas, I would ask for a Hades:)

I'm not bothered about the quantity but the prices of software are well
out of line.

I won't post his name but he has a studio in Brooklyn, has worked with many top artist in the music field (several gold records). His studio was profiled in an issue of "EQ" a US magazine. His secret is a C-Lab Falcon with CAF. He also owns a PowerMac 7600, not to mention a few other pieces of gear.

To be honest its not the gear, its how you use it or do you know how to use it. Many gold records are still recorded on paper. The Falcon or any other platform with a sequencer (or better a combined audio/sequncer) is a handy tool in the song writting (composing) process. At least for me. Still, all my recordings end up on a ADAT tape.

Non-linear for jumping around will working on parts and when everything is (oopps "will" is supposed to be "while") done, it all goes onto a ADAT. A Falcon with the latest version of CAF or AudioTracker very stable. I have multi-channel analog ins/outs, S/PDIF in/out and a ADAT Light Pipe in/out.

Regards,

Rich

>Indeed?

Yes.

>It's trivial to port and easy to augment because it implements
>very, very few services compared to the MacOS.

It implements functionality for dropdown and popup menus, windows, alert
and dialog boxes, provides 1000 RGB levels (24 bit graphics cards only
need 256), several device independant routines for drawing circles, arcs,
rectangles, lines, etc., font management (today also including Speedo (tm)
and TrueType (tm) fonts), a far more acceptable memory management than
MacOS, etc.. MultiTOS (or N.AES) provide loadable file systems, preemptive
multitasking and many more very unix-ish functions.

>GEMDOS is essentially a
>slightly cleaned up DOS (if you look at the calls, they're nearly
>identical).

GEMDOS is the weakest part of an Atari's OS, but it's not a part of GEM.

>GEM is a very simplistic windowing system. It all fit in
>200K because it did so little.

See above, define "little". MacOS didn't even come with subdirectories
("folders") when it was new.

Quality and pricing of apps compared to TOS ones is not good? Please list the
apps and prices compared to the equivelant TOS ones..

Why not try the Mall stores and the superstores.. Or try the mailorders like
MacZone, MacWareHouse, MacConnection, ClubMac, GDW and MacMall? I rarely buy
from the mall stores.. Why should I pay at least $30 more per app when I can
get from one of those mailorder firms the next day for additional $3 and no
tax? I am sure you recieve those nice glossy catalogs weekly..

You're money.. The Q840AV had some quality issues that may have not been
resolved after discontinuation.

I don't know what world you live in, The cheapest Mac clone now is the Umax
C500 at $1299 for a 160mhz 603e, 16 megs ram, 1.2gig, 8xCD, 16 bit sound,
keyboard, mouse and software bundle.

Infinity is selling clone kits starting at $899 for a barebones Tower unit that
includes a Motorola motherboard(603e - 160 mhz). Prices will drop as usual..

Where selling the Performa 6400/180 for under $1500..

I don't see the performance gain for an 040 Hades when the price is higher than
the Umax 600-240Mhz 603e Tower for $2299.. The C600 just smokes it..

Actually the mac clones and some Apple models are cheaper than equivelant
Pentium clones. Plus you spend time actually using the machine instead of
figuring out the ins of wintel..

Oh, please..I don't think you can articulate ideas like he can.. If you could,
who needs Rush?

I know a lot of Conservatives who despise Rush. They know how to think for
themselves and articulate ideas and thoughts. And these conservatives despise
your wanna be's because you need Rush to think for you..

We do not have a popular Liberal one because Liberals do not need one to think
for them..

Macs have no retail presense? Have you told this to Ireland Technologies down
the street from where I live, Best Buy, CompUSA, OfficeMax, ComputerWare,
ComputerTown and to much to list..

I don't know what you smoke on your homeworld, Can I have some...:)

> A few lines in more financially oriented publications will not counter
> this. Then the general public will see the Mac's pathetic storefront
> presence and jump to conclusions.

So RollingStones and other lifestyle Gen X publications does not count?

Ha ha ha..So desparate..Mailorder is meager compared to the rest? Have you
told this to GateWay and Dell?

Apple is holding their own and letting the Mac clone firms to expand the
market..

> The percentage of consumers that exist within that market really is

GateWay 2000 is mailorder only. No retail presence except for the Destination line which has not done well.

You need to lookelse were from the star trek rags. I don't see this general lack of retail presense. At least not in Iowa..
>
> It may not reflect reality but, it need not do so. That is the point

Actually it is the original Mac OS 1.0 that ran on a 128k Mac.. Such efficient
and tight code. Progress tookover and the added hardware became commodity.

> This trumps MacOS by quite a bit.

I don't think so..

>>TOS has no were the functionality, features and technology that is tied to the

> Apple must do this despite all of it's admittedly superior resources.

Didn't Atari try to copy apple speak to keep up.? Like adding a laser printer
and publishing app. Not very original..

> It is truely sad when the OS offerings from an orphan can compete
> with a giant like MicroSlop and the OS offerings from another giant
> cannot.

I didn't know the Mac is an orphan.. One is sold every nine seconds..

> Your blind loyalty is a greater threat to Apple than MicroSloth and all

Please explain further.. Also quote the higher prices to..

> Apple has gotten a free ride from the likes of you in the past and is
> now paying dearly for it.

And how is that? I have benefited from their screwups..Like buying a box with a gig and awesome software bundle new for $899.. Much cheaper and useful to boot than a Hades..

Have not used those two...so I can't honestly say about them. (but oh, boy
do I doubt it!)

The only other OS that I've used (and that includes TOS, DOS, Win 3.x,
Win '95, Mac Sys. 7.x, and Linux) that I would even remotely consider
over TOS would be WorkBench 3.x on the Amiga... :)

I agree, application availability is better - but many of the
applications I am running on my PowerMac are not of substantially-higher
quality than my better TOS ones - Papyrus, for instance. Certainly,
there's no need to "upgrade" if you are only looking to get a better
word processor or DTP program, since the TOS ones are quite comparable
to the Mac ones (and TOS is more stable).

I grabbed my Performa 6320 (120 MHz 603e) for $1500 at Staples,
including monitor, KB (oooh, they even gave me a keyboard! :')), mouse
(whoohoo! a mouse! how generous! ;'>) and a load of CDs with a lot
of crappy software and some decent stuff.

I am running SoftWindoze 95, which is competent, and a tad faster here
than on some friends' 486/66 DX2s. I plan to get MagicMac, so I can
continue running some of the better TOS apps (like Calamus SL).
Purchasing a replacement for Calamus on the Mac platform would set me
back over $700, something I'm not too keen on right now.

Really, it's not as bad as JEDI infers, nor as blissful as PSD
proclaims.

I most probably won't, probably get a UMAX Apus Tower.

>Quality and pricing of apps compared to TOS ones is not good? Please list the
>apps and prices compared to the equivelant TOS ones..

No I'm sorry Pete, the programs may have more features and all the
stuff you list as usual but pound for pound they aren't as good value,
I don't want to pay for features that I don't want. Some of the fun
and very lightweight apps are well priced but go for Word/Excel and
that's 250UKP each, Pagemaker 400UKP, Photoshop 400UKP. These prices
are all well and good if it's the core of your buisiness but if you
think I'm going to spend 800UKP(+VAT!) to do a bit of image
manipulation and design my web pages then you are quite wrong.

>> Which

I'm not one to pick up on peoples bad spelling (mainly because my
typing is so bad) BUT Pete, you've done this many a time and said
"You're money" for someone who supposedly work in a library this is
awful. As I said before "I am not money".

>I don't know what world you live in, The cheapest Mac clone now is the Umax

In the UK this costs you just under a 1000UKP.

: TOS is no more than a hack put together by the now defunct Digital Research

GEM means "Graphics Environment Manager" and was essential written by Gary Kildall and team at Digital Research. GEM embodied the best of the office analogy graphical user interfaces. Elegant, coherent and logical. Gary Kildall is not with us anymore (so he can't defend himself from you) and GEM is now owned by others. TOS was written by a team at Atari and, for the time, one of the best of the operating systems. GEM and TOS work very together.

I really thought you were interested in recruiting Atarians to the Mac. I think you are really an Atarian who is angry that the Tramiels didn't develop your favorite computer to full potential.

Why don't you spend your time over at the Mac groups helping newcomers learn their machines. Wouldn't that be more gratifying?

I use IRIX extensively and I beleive that it is the best operating system
that I have ever encountered. It provides all the functionality of UNIX
with an absolutely beautiful and functional X/Motif interface.

I've looked at the features offered by QuickDraw and GEM. QuickDraw wins,
hands down. It is easier to use, more flexible, and offers a more
complete set of graphics primitive calls. It has very powerful features,
like clipping regions (which, as far as I know, exist in no other graphics
API). Some of the really simple things, like the ability to create
offscreen buffers that can be drawn to with the standard calls, are
completely impossible in GEM (unless my memory deceives me).

(BTW, just in case you were wondering, QD provides 65536 levels for each
primary color -- its internal color representation is 48-bit.)

> a far more acceptable memory management than
>MacOS, etc..

Are you kidding? Basic TOS has *no* memory management, or at least not
enough to talk about. It just runs a program and gives it all the free
RAM in the machine. (We were talking about what fits in 200K, remember?)

> MultiTOS (or N.AES) provide loadable file systems, preemptive
>multitasking and many more very unix-ish functions.

MultiTOS was crap. I say that from experience. :)

I've never used N.AES, whatever that is.

In any case, these are *extensions* of TOS. The original message said
something to the effect that TOS was better than MacOS because it was
trivial to port and easy to augment. I was pointing out that these things
were due to the extremely spartan nature of TOS.

>>GEM is a very simplistic windowing system. It all fit in
>>200K because it did so little.
>
>See above, define "little". MacOS didn't even come with subdirectories

>("folders") when it was new.

Yeah, and it was new in 1984. I'm pretty sure HFS got introduced by the time the Atari came out. (I think it's obviously no argument that HFS blows away the FAT file system used by TOS.)

>programs sharing a single logical address space.

If there is more than one logical address space, that means that addresses are virtualized, which is what you need to avoid fragmentation. VM, virtualized adddresses, and memory protection are so interrelated that it is unlikely OS/2 can really stop having a virtual addressing system. (Nor would they want to, since good memory management is a lot harder when blocks have to be physically contiguous.)

>Can someone explain one aspect of the PowerMac VM to me please?
>A Get Info on an application typically says something like "minimum
>memory requirement reduced by 1300K if running with VM on".

When VM is on, the PowerMac treats the executable code of a PowerPC native program a bit differently. The executable is not allocated inside of the normal address space. This is because the program file itself is used as the backing store, instead of the systemwide swapfile. That's possible because PowerPC code, by definition, is never modified once loaded from a file. Since all PowerPC program code sits outside of the main address space, it effectively isn't taking up any of that address space. That's what allows the reduction in minimum memory requirement.

The number in the Get Info box reflects the exact size of the program's code fragment. If the file is actually larger, that's because Macs store a lot of stuff besides code in a program file.

You can improve this. Apple tends to put a ton o' crap in the Extensions
folder that the typical user doesn't really need. One big thing is that
if you aren't on a network and don't use an AppleTalk printer, you can
turn off AppleTalk to regain some memory and speed.

I highly recommend Speed Doubler; if you can afford the 800K RAM penalty
it makes the machine a LOT snappier. Sorta like TOS+Warp 9. :)

>Where TOS excels beyond Mac machines:
>
>1) Stability. I have crashed this Mac more that five times as

You might want to get your System upgraded to 7.5.5, if it isn't already
at that version. 7.5.2 and 7.5.3 have had notable stability problems.
7.5.5 isn't perfect, but it does seem to be a lot better.

That sounds like a Claris Works problem. I am able to crank up multiple
FTP sessions in the background on my Mac with no problem. The
communications tools in most "Works" programs are notorious for being less
than solid.

Could someone please tell me what this disucssion has to do with video games?

Other than the fact that -- depending upon your political perspective -- some would want to see a game where you save Rush from the liberals or destroy Rush as a liberal.

Please take stuff like this to email or the approiopriate group.

And for the record, I have voted for both Bush and Clinton.

m ike dougherty

Easy, as it's much larger.

Offscreen bitmaps are IIRC implemented in NVDI >= 3.0. Clipping areas,
though, are not.

So why are you mentioning Quickdraw, then?

>> MultiTOS (or N.AES) provide loadable file systems, preemptive

>
>MultiTOS was crap. I say that from experience. :)

MultiTOS was never finished (the AES was still not completely adapted to
run sufficiently fast under MiNT), that's why. Version 1.08beta was much
faster, according to it's testers. And even MultiTOS needs much less

processing power than MacOS.

>I've never used N.AES, whatever that is

A replacement for the MultiTOS AES.

>In any case, these are *extensions* of TOS.

An AES is no extension, it's an elementary part of GEM.

>The original message said
>something to the effect that TOS was better than MacOS because it was
>trivial to port and easy to augment. I was pointing out that these things
>were due to the extremely spartan nature of TOS.

Nope, they are due to the portability and easy improveability. Products
like MagiC show how easily clean GEM and TOS programs run under a preemp-
tively multitasking environment, MultiTOS or it's inofficial heir N.AES
show what "easy augment" means, just like NVDI, MinixFS or MiNTnet do.

>>>GEM is a very simplistic windowing system. It all fit in

And HFS is blown away by MinixFS.

NVDI and NAES are not 'extensions'. They are REPLACEMENTS.
GEM is structured in a well organized and layered fashion.
Each level can be replaced quite independently of the others
so long as the base API spec is adhered to.

>
>>>GEM is a very simplistic windowing system. It all fit in

It was made to fit the machine. It's a shame no one ever bothers
to do that anymore. GEM austerity surely trumps planned obsolecence
and OSes that cant fit into the memory space of the machines that
they were delivered with.

Hey!

This is a thead relating to video games, not stupid poltical liberals and conservatives crap that SinClap made the whole thing out to be.

It's bad enough having him come on the Atari ST newsgroups saying how crap the platform is, now he's pushing liberalism in everyone's face. You think he's a big Hollywood producer or something.

Everything has it's place...

ST's, not Mac's

and video games, not politics

Have the right to speak your mind, but use some bloody common sense and responsibility!

BTW, before anyone balls about me crossposting...1) It's already crossposted before I even responded to it and 2) I'm trying to stop it from getting out of hand.

As for Jag controls, I really was hoping they become as wide spread as the Sega controlers. I really would like to have all ST computers to use those. So if alot of people do buy them, then let me know...then I'll feel better :)

Using a soapbox as a footstool instead...

Eric Noss
a.k.a
Mr. Maddog

When the conventional media harks upon the imminent demise of Apple,
their lack of presence in the marketplace only reinforces this idea
to those who might otherwise consider a Mac.

The desperate advocacy attempts that too closely resemble the
Atari Revolution don't help either...

Self modifying code is very expensive in most cached architectures (especially ones with split cache) so it is very reasonable to exclude it from the PEF.

This is true, except for the $30.00 more per app at Walmart.
My statement was, "Go to Walmart and try to purchase some Mac software
on
a Friday night binge. Good luck." Sometimes I like to go shopping with
my
family, and sometimes we end up at WalMart or the Wherehouse. Been a
while

since i've seen Mac apps there. I wasn't talking about a "planned"
purchase.
My budget dosen't require me to "plan ahead". If i'm out at 10:00 pm and
see
something I "want" I buy it. As far as the superstores go, very rarely
do they
beat the "Zones" prices, but it is funny to see all the Mac's piled up
in a
little corner with three or four models being shown when 3/4's the store
is full of the latest PC crap and the other 3/16 full of PC software and
add on's. That leaves about 1/16 for the Mac market. Yea, I get the
glossies
weekly at work where my Uncle buys everything I want out of it:) If I
don't
like it, I give it away. Spoiled bastard, arn't I:).
I'll bet it drives you insane that a 1986 1040STF with a VideoMaster is
used
to inspect mirrors for weapons in use by the U.S.....well, lets leave
that
part out. The 1040 fits nicely under the Zygo and didn't cost our lab
but
about $150.00 in hardware.

Do it again. Peter.

>

Spoken like a Gentleman. Well said. I totally agree there are some
awsome products for the Mac that will never be matched in the TOS
market. However, there are some TOS apps that just can't be passed
over, as most current and ex-TOS users know.

> > resolved after discontinuation.

No problems here. It's a very nice machine for the price, and is a
complete
package not needing a fist full of cash to get it started. You can
actually
start out with just MagiC Mac, decide which TOS programs to keep and
which
to replace and go from there.
If you have the cash to blow, get an SGI.

> >

> of crappy software and some decent stuff.

Kind of high for a slow Mac isn't it? Indeed, Sinplop has stated this
many times over. Not once does he compair the 120mhz to the Falcon or
Hades, it's always the 220mhz 603e or the beastly 604e. Can you image?
Why even compair a 180mhz 603e to the Falcon. It's just plain stupid
and a method to keep threads like this going. We are talking about a
16mhz 030 machine here are we not? But as slow as it is, like the
action on a 44 mag, some prefer it to what else it out there.

>

Cross-posted to: alt.crews.atari,comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.programmer,comp.sys.atari.st.tech

New version of NoCrew's MPEG Audio Layer II realtime DSP player for Falcon
is out now!!

Latest version is 0.95 with lots of new features from the last one. (0.7)

* Dynamic buffer allocation
* Config file
* Drag & Drop protocol supported
* VA_START message supported
* Keyboard control
* Automatically find the next song
* New buttons:
* Skip to next
* Skip to previous
* Fast Forward
* Count direction

Read more about this product on http://noring.org/mp2 where you also can
get the latest version. It can also be found on ftp site:
ftp://ftp.nocrew.pp.se/pub/nocrew/tos

Download, unpack and blast away with your mp2 songs playing in the
background, taking no CPU time!

Mpeg songs can be found at http://www.iuma.com or ftp://ftp.iuma.com

!!!!!!!!!!!! NOTE !!!!!!!!!!!!
ONLY STEREO SONGS ARE SUPPORTED

Let's hear now what the public has to say about this.

Anders Eriksson, aka Evl of DHS: "BLOODY WELL DONE!!"

I'm not sure if he was talking about the player or his dinner though.

This is a dream coming true for every Falcon user, try it now!!
Send donations afterwards! :)

Tomas

Not the original version which fit in the 64K ROMs of the Mac 128.

>>Are you kidding? Basic TOS has *no* memory management, or at least not
>>enough to talk about. It just runs a program and gives it all the free
>>RAM in the machine. (We were talking about what fits in 200K, remember?)
>
>So why are you mentioning Quickdraw, then?

QuickDraw has been around since the beginning. Its feature set beat GEM
then. The major thing missing was full color support (in the era of the
B&W Macs, QD supported an 8-color scheme that was never really used). But
in a graphics API, color support on the level of setting a color to draw
in is trivial to implement. And that's basically what GEM has.

>>MultiTOS was crap. I say that from experience. :)
>

>faster, according to it's testers. And even MultiTOS needs much less
>processing power than MacOS.

Would you say the same of Linux? I've got a benchmark that runs faster
under MacOS than under Linux, on the same Mac. And no, it wasn't built to
do that.

>>I've never used N.AES, whatever that is
>
>A replacement for the MultiTOS AES.
>
>>In any case, these are *extensions* of TOS.
>
>An AES is no extension, it's an elementary part of GEM.

Did you or did you not read what I was saying? TOS = what's in ROM.
N.AES is replacement for MultiTOS AES, which in turn is a replacement for
the ROM AES.

>>The original message said
>>something to the effect that TOS was better than MacOS because it was

>>trivial to port and easy to augment. I was pointing out that these things
>>were due to the extremely spartan nature of TOS.
>
>Nope, they are due to the portability and easy improveability.

And where does the portability and improvability come from? Mainly from the fact that the base TOS system is, as I have been trying to say all along despite your continual sidetracking, a very simple and spartan OS. The simpler they are, the easier they are to port and improve upon. Is it too difficult for you to understand that I am not trying to argue anything else?

>>Yeah, and it was new in 1984. I'm pretty sure HFS got introduced by the
>>time the Atari came out. (I think it's obviously no argument that HFS
>>blows away the FAT file system used by TOS.)
>
>And HFS is blown away by MinixFS.

Sorry to break it to you, but it simply is not. MinixFS is a simple i-node file system, which, while much better than FAT file systems, is not too hard to beat.

Let me give you an example. On the four partitions I have mounted on my Mac desktop right now, there are roughly 9,500 files. If I try a find file on a phrase that doesn't exist in any of the filenames on any drive, it finishes with no matches found in about 1.5 seconds. That's for searching the entire directory structure of each drive. I very much doubt any inode file system could do the same.

I've not even heared of IRIX but from what I have heared BeOS is a
superb bit of kit and if I get a Mac I will be only to happy to
install the PowerMac version when it is released. The problem with
MacOS & Windows is the need to retain backwards compatability to the
very earliest of machines, with BeOS they have a brand new OS written
for the new hardware. It's taken the modern good bits of MacOS and
mixed them with the simplicity and power/efficiency of TOS, making an
OS that is just right.

>
>Yup, no self modifying code :(

You can't have it anyway. Self-mod is a no-no on any CPU with split
instruction and data caches, whether it's the 68040 or PowerPC 604e. (You
can write self modifying code on the 601, because it uses a single unified
cache, but it will break hard on the other PowerPC processors. Not
recommended.)

The lone exception to that rule is probably the x86. Intel spends extra
silicon to allow even the P6 to execute self modifying code correctly,
without any forced cache flushes. They probably did this solely because
of the pressure to maintain full compatability with really old DOS
programs, etc.

I have 6 partitions on my 4 meg/TOS 4.04 Atari Falcon...that equals 492
folders and 5,427 files...using the standard, drop-down search option
from the menu bar, I can do the same search with results in around 2
seconds... :)

Hi Thomas,

I currently own two Atari machines, a 1040STE and a Falcon. They are both very good machines, but Atari have really left users to fend for themselves. Fortunately, other companies have taken over where Atari left off. There are a few Atari clones around, such as the C-Lab Falcon I, II and MK-X, the Direct TT040, 060, Medusa040, 060 and the Hades. There is even a new machine being developed in France.

Although the Computer market is hardly flooding with Atari Software there is a good supply of quality software, both commercial and shareware.

It seems that as one more company abandons the Atari market and makes me re-think whether or not I should continue with Atari, another Company takes its place.

I hope to stick with Atari as long as I can. I don't wan't to have to switch to a PC running crappy Windows, which takes so much processing power to run, you need at least a Pentium before you've even started.

Anyway, enough of my rambling.

Cheereo,

Ben Hills.

: OS that is just right.

Can you see a little bit of GEM in the BE GUI? If so, then that would be great! And, if so where would I get to see the thing?

I always hated that the Mac was a "GUI by committee" with Jobs breathing down the committee's neck to "get it finished". GEM was the vision of one person, Gary Kildale and shines because of it!

Ah, now I see. You are using "simple and spartan" in the meaning of "slim
and resource friendly". Sorry, my mistake. Seems I need to brush up my
English a little.

>The simpler they are, the easier they are to port and improve upon.

The fatter and crappier in source they are, the less. Tells one about
MacOS when one reads the estimated release date of System 8.

>>And HFS is blown away by MinixFS.
>
>Sorry to break it to you, but it simply is not.

Copying a file on MacOS lasts significantly longer than on any other FS,
including the original TOS-FS, e.g..

New Atari applications _certainly_ do! And by new applications I mean app's from 1991/92 so forth.

And Atari's have pre-emtive multitasking OS, namely MagiC and the very powerfull MiNT+MiNTnet+N.AES which has support for BSD sockets and built-in _true_ TCP/IP network at OS level thanx to MiNT-Net which is a socket.

Things which MacOS doesn't have!

......And will never get either, since Apple has cancelled the development of CopeLand, the "next generation" MacOS that was suppossed to be pre-emtive.

> There have been previous Mac apps that failed the guidelines and as a result
> failed in the market..

Just as MacOS has now, and Apple seems to admit it by cancelling the CopeLand projekt!

Of course there's always BeOS, which has been ported for Mac hardware, but it is by no means compatible with MacOS software.

Since disk access is handled in server code rather than in kernal code,
the kernal of the particular linux flavor doesn't matter if we assume that
the server makes little use of the kernal. This is the case. Of course the
loading of the kernal from disk at bootup is done in kernal space.

TOS stands for "Tramiel Operating System" or "The Operating System".
Take your pick. It is similar to other operating systems. "TOS controls
the way the computer works, handling tasks such as reading from and
writing to disks, translating mouse movement into onscreen cursor
movement, and displaying information on the screen." - from the MegaSTE
manual.

GEM is part of TOS (also from the manual!). It was written by Gary
Kildall and team at Digital Research Inc. (DRI) and recoded to work as
the GUI (under TOS) for the ST line of computers. GEM was originally
written as a GUI for the PC (I am told and I really don't know why it
wasn't successfull in that regard.) Gary Kildall passed away last year.
GEM is (IMHO) the very best of all the office analogy GUI's as it was
written with one persons vision (Gary Kildall) and it really looks just
like a simple office. It originally had icons for file drawers, folders,
files and trash cans and directories would list out on virtual sheets of
paper. Why MS called them windows I have no idea. Windows have nothing
to do with an office. Double click to run programs - how easy can you
get.

Atari did very well to go to DRI for their GUI instead of writing it "in
house" (although they probably could have with no problem). I also
understand that the Jay Miners (sp) AmigaDOS and GUI is exceptional.

Slightly less than using Workbench. Multitasking is limited to
Desk Accessories/TSRs.

It's an austere beast. Essentially, it is a minimal working set
for a GUI based OS & UI. With TOS/GEM you can do most of what
a Mac or Win user would want to do but on much less powerful
hardware. It is somewhat Amigish in this respect.

Exactly...It kinda reminds me of some of those Sci-Fi scenarios when
Mankind is confronted with older, more advanced technology, and he is
in denial, or at the very least confusion... And even when Man's -
existing Technology is more advanced-they are awed by what was done
by the Elders before...

Well, there has been some debate, but I go with "The Operating System"...
I've heard "Tramiel Operating System" as well.

TOS is probably the single-most "friendliest" OS in existence...at least
as far as the OS's I've used, it is...Like the Amiga OS, its footprint
is very small, and uses resources very efficiently. There are apps that
you can "install' for almost every major form of picture/sound/anim so
that a double-click on the ext. (say *.GIF/*.JPG/*.TGA/*.MOD/*.WAV, etc)
starts the associated app and bingo!, the file is shown, played, run,
etc,.. File Ops are the most logical of any system I've used. Most of TOS
is in ROM so we don't have near the fear of viruses that the Mac/Win
world does...TOS runs well in an 8mhz enviroment...but of course, really
shines the faster you push it. There is lots more, but I just don't have
the room...Having owned Amiga's (A2000, A1200, and I still have a very
venerable old A1000 that I can't bear to part with because of Jay Miner
and his dogs signature) I can say (despite the ancient Amiga/Atari wars)
that users of both machines have more in common than with Mac/Wintel
hardware/software...I have an AMinet CD on my BBS as well as Atari and
PC's...(umm...6 CD's total now) :) Oh well, I've typed long enough here
I suppose-I hope I've at least shown you a small part of the TOS world,
and if you are really interested, then by all means, download some of
the various FAQ files about the ST/Lynx/Jaguar/Portfolio/Falcon/TT and
the new clones...See ya 'round Cyberspace! :')

No, Linux. There is an experimental monolithic Linux release for the PCI
PowerMacs.

>>TOS = what's in ROM.
>
>MacOS= what's in ROM.

Nope.

MacOS was never shipped as an entirely ROM-based OS. Parts of it have
always loaded off disk. TOS is ROM-based (except in the early days, when
it was disk based solely because they hadn't cut it down to 192K to fit in
the ROMs as intended). Things like MultiTOS entirely bypass the TOS ROMs.

>>The simpler they are, the easier they are to port and improve upon.

That's really a mixture of unrealistic design goals and horrendous
management problems (management problems are what sunk Atari, after all!).

Correction. This is true for the traditional Finder copy routines, which
are known to be way less than optimal. Speed Doubler, in addition to
containing a faster 68K emulator, replaces the Finder copy routines with
code that can copy at the maximum possible rate (i.e. as fast as the disk
can transfer data in raw block tests). I have timed it; it achieves 5MB/s
copies on my 5MB/s drive, and it hardly slows down even if you are copying
a large number of small files.

Preemptive multitasking, not yet (except in a limited way), but MacOS has
had true TCP/IP network support at the OS level for a very long time. Or
is there some way in which MacTCP is somehow not "true" TCP/IP?

Open Transport is Apple's latest. Open Transport is basically a port of
several UNIX related networking systems (STREAMS, the X/Open Transport
Layer, etc.). It comes with drivers for TCP/IP and AppleTalk, and drivers
are available for a whole slew of other network protocols.

>......And will never get either, since Apple has cancelled the development

Actually, the word is that OS 8 (Copland) is continuing development, but
not necessarily in the same form that was originally discussed.

What is expensive? Memory? HD? Maybe in the TOS world it is.

Not when it includes the Apple 15' multiscan monitor.. The 6320 is no longer
manufactured and has been discontinued. Considering what he paid for it and
did include the monitor. So in essense it stomps on the Falcon for
price/performance.

The slowest desktop in Apple's retail arsenal is the $1500 6360. Not bad for
what you get compared to the Falcon..More computer/less money describes the
cheapest Performa in comparison to the Falcn.

> Things which MacOS doesn't have!

Thats funny, I swore I had Mac TCP and Open Transport laying around in the HD.

Things TOS machines do not have are decent internet apps like a Netscape browser.

> ......And will never get either, since Apple has cancelled the development
> of CopeLand, the "next generation" MacOS that was suppossed to be pre-emtive.

Apple has cancelled Copland not Mac OS8..

>> There have been previous Mac apps that failed the guidelines and as a result
>> failed in the market..

I suppose selling millions of units annual is a sign of failure plus the addition of Mac OS clones..

As for Copland read above..

If you believe Mac World (Sinclap sure quotes them a lot.
are you taking over for him while he is on X-Mas vacation?).
you will never see a Mac O/S with the name Copland. They intend
to offer much small bug fixes and improvements rather than a totally
new O/S offering, again according to Mac World.
One thing is for sure. With Apple being so indecisive, clones
being produced that have the ability to run O/S's other than
the Mac O/S, and the Be O/S coming, the future will be interesting,
inculding TOS clones. One can only hope that for some strange reason
SGI drops the price on an INDY to $1999.95. We would then however,
have nothing to debate.

Hell, no! The day I take over for that moron is the day they put me in an institution. Mainly I'm here because I'm bored and I see a lot of people saying untrue things (many of them are overreactions to Sinclap, the Advocate Who Will Not Die).

I'll be going on christmas vacation very soon now myself, so if you see me drop out of this thread, don't be surprised.

>you will never see a Mac O/S with the name Copland. They intend
>to offer much small bug fixes and improvements rather than a totally
>new O/S offering, again according to Mac World.

No. They intend to release "reference versions" every 6 months, and updates 3 months after each reference version. It is unclear what exactly will happen to the mass of code developed for Copland, execpt that the user interface and similar noncritical stuff will get added to 7.6 3 months after 7.6 ships in January. However, the general gist has been that OS 8 technology will be fully developed. They're just not holding up every piece of it to wait for the preemptive multitasking and memory protection parts.

The most plausible of the recent rumors surrounding Apple and Be had Apple using the BeOS application programming model on the microkernel developed for MacOS 8, with MacOS 8 APIs like QuickDraw GX, the device driver system, etc. If there is anything to these rumors, Apple is now more willing to abandon the legacy MacOS architecture in favor of a clean architecture with an emulator box for 7.x applications.

Indys are discontinued, I think. I doubt that SGI is going to drop prices that low soon. It's not their market.

Alphas, on the other hand, may be poised to jump on the Pentium Pro market. It's looking like the 21164PC, Digital's low-cost Alpha, is going to compete *very* well in price with the PPro, for certain markets.

6718. Small Office System

Newsgroup: comp.sys.atari.advocacy
Date: 1996-12-13 00:00:00 UTC
From: Mark Simms <mark@bri.hp.com>
Message-ID: <32B142C6.26B4@bri.hp.com>
Source record: 7327
Cross-posted to: comp.sys.acorn.advocacy,comp.sys.amiga.advocacy,comp.sys.atari.advocacy

I am, oce again looking at the computer market in an attempt to find a good home office system. With the increase in price of mainstream computers, buying something non-standard looks a bit more attractive. So I am looking for recommendations.

The system must run standard office productivity tools including a word processor, spreadsheet, database, drawing package and terminal based communications package. The word processor must support multiple proportional fonts in arbitrary sizes, multiple columns, colour output and inclusion of drawings. The spreadsheet must support at least 2000x2000 cells and ability to access and process all the functions from Lotus version 2 files.

The choice of system will be judged on ease of use, cost and reliability, provided the basic functionality has been met. The obvious system to compare with is the current low end Apple Macintosh Performa with a colour inkjet printer. This comes with Claris Works as standard which is a market leader in ease of use for an integrated office productivity package.

Any systems suggested must be complete and include any necessary software as well as all the hardware necessary, including a printer. Price estimates are important as well as information about sources for any software that is not bundled with the system.

I look forward to hearing any suggestions

Apple ships MkLinux with all the source code. Anyone who wants to write an operating system for the PowerMac can use it as a guide. Also, Be has sucessfully ported BeOS to the PowerMac PCI series and has indicated that Apple was very helpful in providing necessary hardware details.

6722. RE: Quadra 840AV quality problems (Was 840AV and MagiC Mac)

Newsgroup: comp.sys.atari.advocacy
Date: 1996-12-13 00:00:00 UTC
From: Michael Grove <mgrove@ridgecrest.ca.us>
Message-ID: <32B13410.6E1D@ridgecrest.ca.us>
Source record: 7331

After searching through a few hundred
doc's at the Apples developer site,
I found some information on a "bug"
with the Q840AV. Not to be specific,
there was a chip change in this model.
This chip had tighter timing requirements
than the previous Quadra line machines.
Some manufactures of expansion cards wondered
why cards that worked fine in Q700-900's
now would cause the machine to hang,
even with no bus activity.
With the timing narrowed, and the
aftermarket cards having a loose
timing tolerance, the cards failed.
There was a technical programming
explaination given to the developers
on how to bring their cards up to spec
with software solutions.
I only mention this because someone had
posted that this may not be a desireable
machine to run MagiC Mac with because
it had quality problems. The quality
problems, from the two or three hours
I spent reading, were with the aftermarket
hardware and not the Quadra 840AV itself.
If you need a PPC spend the bucks. If you
want to run MagiC Mac, enjoy running TOS
applications 4 to 6 times faster than a
Falcon and don't care about spending more
bucks for Mac software, get the Quadra 840AV.

Mike

Actually, I believe that they think that this will help them. Since PPCP boxes will probably ship in Q1 of next year anyone will be able to write an operating system for them. By providing PPCP operating system makers hardware details for the PowerMac line they might be attempting slow their obsolesence.

You can't compare Apple's retail presence to Atari's near zero retail presence. The mall software stores next to Wal-Mart that I have been to had decent section of Mac apps but at higher prices compared to MacZone. I don't know about you, I like to save money even it means calling an 800 number and paying $3 for over night shipping. Gotta make use of the bazillion Mac catalogs I recieve every month..

I keep all of the catalogs for the on campus demos to pass out.. I like to save my customers money..

I wouldn't go far as that.. In my lakes of the woods, I can count at least 5 retailers who have Macs..And this includes one Mac only reseller..Must of been the reason why the local Wal-Mart drop the Performas. Both were selling the same models at the same price. The difference was that the Mac reseller provided alot more support and the people have a clue..

If he wants to see Gateway... all he has to do is watch TV for
> awhile. They'll come to him, like any sane merchant.

And he/she wants an alternative Apple branded Mac can call PowerComputing. What is your point.

I wouldn't go far as saying that the Mac had half the space.. All I can say is that Iowa is saturated with Apple resellers..Must be blissed..Considering were sterotyped as being just rural..

You should get a car Jabba and get out more..

It doesn't have to compare. It really is quite irrelevant. Bashing
upon Atari will do nothing diminish that fact that Mac is diminishing.

$>The mall software stores next to Wal-Mart that I have been to had decent

Mall software stores? Really, you must be joking. Those places are
more likely to have more Atari (jaguar,lynx) software than Mac. Those
places stopped supporting Apple (mac & apple2) at around the same time
they gave up on the ST and the Amiga.

Only chain superstores carry anything Apple these days and you wont
find them at the mall. If you target audience never ventures outside
the mall the Mac is as dead to them as Atari or Amiga.

$>section of Mac apps but at higher prices compared to MacZone. I don't know
$>about you, I like to save money even it means calling an 800 number and paying
$>$3 for over night shipping. Gotta make use of the bazillion Mac catalogs I
$>recieve every month..
$>
$>I keep all of the catalogs for the on campus demos to pass out.. I like to
$>save my customers money..

This is all fine and dandy if you actually go to the effort to reach
your customers. Apple simply does not do this. One is more likely
to see an add for the local garage PC shop than for an apple of any
kind.

$>
$>> He doesn't need to. There will be Aptivas,Pacard Hells,HP's,Acers

ROFL! Only if it is was true. PowerComputing is the fastest startup company this year and will have sold hundreds of thousands of units this year. Will most likely exceed a million units for '97' Not bad for a two year firm. While Umax/Supermac will be a success as they are today. Plus Motorola has started cranking out units in the tens of thousands and will catch up to Apple's 4 million plus annual units in '98'..

Look for GateWay to enter the Mac market..

Thats interesting..I have yet to see anything Atari in these shops. Just wishful delusions by Jabba..

The local Software ETC has a nice size Mac selection. I still can't understand why they do well Mac app sales when you can buy mailorder and save a bundle.

Only chain superstores carry anything Apple these days and you wont
> find them at the mall. If you target audience never ventures outside
> the mall the Mac is as dead to them as Atari or Amiga.

Well what delusions.. Apple has over 4000 authorized resellers in the U.S. I count for five places in a five mile radius and just as many in the Des Moines area..

You need to get out some more..

> This is all fine and dandy if you actually go to the effort to reach

Huh? Apple does indeed advertise. I may not agree with their message, they do advertise. They advertised many times this semester in our student paper. I have seen their ads in other student papers. I have seen their ads in RollingStones, Fortune, Businessweek, Time, NewsWeek, and lots more..

You need to quit talking out of your ass.

>
> I bet a lot of corn farmers buy macs.

Typical stereotyping.. I have seen lots of Mac ads by resellers in the major
papers such as the LA Times, Washington Post and the New York Times..

> They've got to know about the place first. They'll know about
> Gateway, they'll never know about Power Computing.

Yes they will. PowerComputing is the next Dell and GateWay. They have had
excellent sales this year. They may most likely will exceed a billion in '97'.
A critical mass to fund tv advertising.

Dell doesn't advertise as much as GateWay on tv.

>

BZZZZT! Wrong. I have found dozens of titles for Macintosh in "superstores" all over the country. Does it have the same quantity as PCs? No. But it has beeter quality. Does quality of applications exceed the Falcon? In some areas, yes. In other areas, no. Internet software, particularly CyberDog, and authoring tools - are more mature, albeit more expensive than, Falcon systems.

If you're looking for greater software, hardware, and retail availability, Mac does just fine. Of course, you have to be lucky like me and grab one on closeout so you can afford the Apple-badged ones. There is a firm called APS that sells Mac clones @ 120 MHz for $1399, if you're looking for an el-cheapo system.

But why are we arguing about this? Within two years, we shall be able to run TOS and BeOS and MacOS on the same machine under a Power PC processor, and we can run the best of all worlds.

And retail software support is becoming marginal at best - look at the Babbage's bankruptcy for an example. The Netscape model of selling software via the web will take off as never before. Believe me as an Internet marketing consultant.

Have I abandoned TOS? Hell, no! Much of what Petey says about TOS is untrue, and TOS is still very fast and flexible. But I need more updated tools in Internet authoring. I need a system that has more software availability. That's why I bought a Mac.

I have my original ATARI Mega 4 ST and an accumulation of peripheral stuff - modems, printers, scanners. I still use all this stuff regularly. Never did abandon it, actually. I have a PC - p75 running WIN95 and a bunch of other stuff, but it seems all I really use this beater for is the Internet. I would dump it all in a minute if there were something comparable to NETSCAPE that I could run on the ATARI. I never did think much of the PC and having acquired one and learned to program in VB and VC, if find that it is still just as easy to write a bit more code by hand in MWC or GFA. All the bells and whistles are BS!

A finished program in VB - with all the support modules - is around 2.5 meg (example) while the same program with the same look and feel in the custom interface and done in GFA 3.5 is only 300k! and 200k of that is the custom interface!

ATARI rules!

6734. Is MagiCMac Really This Fast?

Newsgroup: comp.sys.atari.advocacy
Date: 1996-12-16 00:00:00 UTC
From: steved45@aol.com
Message-ID: <19961216125501.HAA09230@ladder01.news.aol.com>
Source record: 7393

I recently tried the MagiCMac demo on my PowerWave 604/132. Keeping in mind that this =is= a demo and may not perfectly reflect the full package, and keeping in mind that the three anims I multitasked were very low end, the overall feeling I got was that this thing ran 6 times as fast as MacOS. What I'm wondering here is whether this really reflects the kind of speed I'd get from the package, and whether the available apps will reflect this speed as well.

Please consider that I have no previous experience with Atari computers. I'm not here to bash anyone. All I can say is that I found the speed and PMT breathtaking, and I want more! :>

Best;
Steve
A4060T & PowerWave 604/132

No, the delusion is all yours. Such places will likely be about half
dedicated to console games and half dedicated to PC software. A few
will still have Atari closeouts. This really says nothing of the Atari
console market. It's just that those platforms were given somewhat of
a chance. These remants are left over from that.

Even that meagre presence is quite a bit more than NOTHING, which is
what they have in the way of apple support.

Well, that explains it. All the apple Dealers are sitting about
in Iowa cornfields, incompetently trying to mock Gateway, while
real population centers are left desolate.

Oh, I forgot... CompuUSA and BestBuy probably count as resellers...

This would be much like McDonald's having all of their many locations
tucked away in some deep dark corner of a Taco Hell.

>
>You need to get out some more..

There are more than enough cornfields in my own state thanyou...

Oooohyeah... all those students with all of that negative cashflow...
...and who have easy access to more computing resources than they
even need...

>RollingStones, Fortune, Businessweek, Time, NewsWeek, and lots more..
>
>You need to quit talking out of your ass.

I'm not. However, print advertisements for PC products quite
dwarf Mac ones. In fact, in that domain, the situation probably
appears WORSE.

Nevermind that not ONE of the cloners was mentioned ONCE.

It would appear, that you only bolstered my point.

In print, Mac is drowning in a sea of clones while Mac's own
cloners are nowhere to be found and not counteracting any of the
PC-tide.

So Mac prices and less support keep the masses away, while the
'converted' jump ship to the cloners.

In the end, the only visible 'Mac' diminishes even more in real terms.

You mean resellers like... CompUSA and... BestBuy?

With friends like that who needs enemies...

Besides, such 'ads' don't generally give any preference to Macs.
They just show how expensive the Macs are...
...how genuinely lame...

It's not stereotyping, BTW. I've driven through that part of the
country. It's downright desolate compared to the rest of the
country. It makes Indiana look like the big Apple.

MagiC, in it's original form, is designed to be able to do what
it does with hardware comparable to a Mac Plus (Atari ST).

Take that level of efficiency, and then apply the power of a more
contemporary machine to it, and the effect you've produced should
not be at all unexpected.

Available apps will be limited however. Atari is an orphan. However,
unless you have some pressing professional need, this should not be
too much of a problem.

>BZZZZT! Wrong. I have found dozens of titles for Macintosh in

Are ANY Mac Advocates literate? I do believe I acknowledged that
'superstores' care Mac wares. It is the stores directly attached to
other stores with a nicely covered and warmed walkway that tend to
not know of Mac's existence. Such places are quite a bit easier to
wander into on a whim.

>"superstores" all over the country. Does it have the same quantity as

120Mhz is pretty weak by today's standards. For $1400 you can get
200Mhz PC systems and get better quality components (from the PC)
while doing it to...

'El-cheapo', loaded 120Mhz Pentia go for less than $1000.

Besides, 'El-cheapo' clones are entirely outside of the scope of
the point you quoted. Join RIF or somesuch.

>
>But why are we arguing about this? Within two years, we shall be able
>to run TOS and BeOS and MacOS on the same machine under a Power PC

I'll believe it when I can buy it. Empty promises and vapourware
mean nothing to me. We were supposed to be able to run x86 software
at speed already on the PPC. THAT never materialized. And while SPEC
numbers for the X704 are dissapointing to say the least, 500Mhz Alphas
can be had for less now than the X704 machines are supposed to cost
whenever it is they are supposed to get here...
...you'd be better off with a Sparc, MAE, WABI & STonX...

Until it actually materializes, all you are doing is farting in my
general direction...

>
>And retail software support is becoming marginal at best - look at the

Everyone else seems to be doing fine... While predictions are nice
and all, they are not of any more value than a palm reading. This
is especially so when such predictions are completely uninformed.
Future and past observable effects seem quite a bit more reliable.

> > network at OS level thanx to MiNT-Net which is a socket.
> >
> > Things which MacOS doesn't have!
>
> Thats funny, I swore I had Mac TCP and Open Transport laying around in the HD.

Hallooooooo, don't you get _anything_, I said at OS-level!

It easy to have a pheudo-network socket running as an application, that method is also being used for singleTOS-users which is also co-operative.
It utterly impossible to have sockets in MacOS, due to it's outdated architecture being co-operative just like plain TOS.

The only things that is "updated" in MacOS is the user-interface, but it's like an old shined-up car, real nice to look at, but doesn't do shit for engine performance.

> Things TOS machines do not have are decent internet apps like a Netscape
> browser.

It's funny you always keep talking about NetScape, is that all you Mac-owners really do when your networking ?

And by the way CAB is getting better and better by the week. In fact the only thing it still doesn't have is the JAVA-virtual machine. Frames, animated GIF's, netscape-extensions, real-audio etc.etc. are all part of the CAB-support.

> > ......And will never get either, since Apple has cancelled the development
> > of CopeLand, the "next generation" MacOS that was suppossed to be pre-emtive.
>
> Apple has cancelled Copland not Mac OS8..

And ? Will MAC OS8 be pre-emtive and have BSD-socket support like so many
other decent OS'es like WindowsNT, MiNT, LiNUX, SOLARIS, IRIX, AMIGA-OS,
FreeBSD etc. ?

If so, congratulations!

- If not, and it's just another "souped up" user-interface, than no-thanx...

It really seems that you're always thinking of the U.S., when it comes to the Mac
market. Have you ever considered that there are a another world outside where
the conditions are quite different ? Like Europe for instance.

By all means the Mac plays a little part here in Europe, but it definitly
has it's difficulties in keeping on the current market. The only real market
it has are specialized - the consumer market and student market is 99.5 %
PC-relative. And there's a good reason for that. Esspecially for a
computer-science student like myself, I would not be really fond of working
with a Mac, the MacOS simply doesn't have the power I need. I'm not
talking CPU-speeds or graphics, but OS-features in general. I have worked
with Mac's, have one myself, they are good computers for some things, but
they're definitly not _the ultimate solution_. My Falcon fills many of
my needs better, than the Mac.

Yes, of course, and by all means they should, But it's only a temporary solution.

Keep Cool and Flying...

You are out of line. Firstly, I am not a "Mac advocate," but am a TOS user who recently bought a PowerMac. Secondly, your attack upon my literacy coupled with a subtle change in literary devices suggests a mendaciousness which I find scurrilous. :') You have a real hate of Macintoshes, and are the Peter Sinclair-Day of the Atari userbase. You intimated that Macintosh software and hardware is difficult to find, and that, in general, Mac users have to REALLY SEARCH to find support. It simply isn't true, at least not in Boston, Massachusetts, USA (which may be different in many ways from the rest of the country, but I doubt in computer support, it is all that different from other cities).

JEDI wrote:

120 MHz is "weak" by today's standards? Why, foolish me, I thought that those $2,000 Sony and IBM systems all ran at 120 or 166 MHz. . . I looked at the $1,000 Packard-Bell Pentiums. What quality construction. The mouse ergonomics are quite. . . er, interesting. Believe me, most users do not want to go to Joe's DOS shack and cobble up a system of their own. Heck, Atari in 1993 had better call-in technical support than most big clone companies have today!

Fact of the matter is, if you are going to measure performance on MHz, the Falcon falls far behind the times, and becomes obsolete. However, if you choose to measure performance based upon some substantive measure (like how easily you get work done), Falcon keeps up nicely, and a 120 MHz 603e even more so. Keep in mind that PowerPC processors are considerably faster than Pentiums at a similar given clock speed.

> general direction...

I see. I suppose that SoftWindows 3.0 doesn't run Windows 95? Hmmm. . . could have fooled me. As for running applications "at speed," I recall no such promise - only a committment to allow compatibility and enable users to switch from legacy Windows to a more advanced processor with a more-advanced OS.

I chose not to wallow in the past and curse the general computing world. You see, JEDI and others, the computer market is having its last great battle for supremacy. If MS wins, and defeats the open Java coalition, we might as well pack our bags, shelve our Amigas, Ataris, Macs, and Bes, and buy W97 Pentium Pro systems. I don't want to let that happen.

Atari lost the war, not through its users incompetence, but through its own short-sightedness, blindness, and stupidity. Remember the problems Dave Small had getting permission to get TOS for an accellerator board for the Mega ST? Remember Atari's absolute hate of cloning and

extensions to the OS? Remember the ST Plus, which was supposed to be a 68020 system with thousands of colors for half the price of a Mac or PC in 1988? Remember the failed launch of the Falcon? I love TOS, I love my Falcon, I like my Mac alot. But frankly, I wanted to participate in the battle against Microsoft, not be a bitter armchair quarterback like yourself.

You see, if MS makes Java WIN32-dependent, you can even forget armchair quarterbacking - you won't have an alternative platform to bash from.

It's common knowledge that retailing is a dying field. Look at Sears, the Macy's bankruptcy, the deaths of major regional stores like Jordon-M, the losses that ComputerCity has heaped on Tandy Corp. Consumers are buying more and more products through the mail, via discount places like TJ Maxx, and the Internet. This is because little value is perceived in the sales experience at a retail store. Every small software retailer from Babbage's to Egghead is losing money and in serious financial trouble. Check the business section of your local paper, or the Wall ST. Journal once in a while. The stories are frequent.

Customers are buying elsewhere - like from Dell and Gateway, both of which have built billion-dollar empires through mail order PCs.

You make that contention - but do not name retail stores. It's not been
my experience. So either your mendaciousness has emerged yet again, or
experience in your quadrant is severely affected by a reality-distortion
field.

As for Apple retail presence "East of the Mississippi", in Boston and
greater New England, we have a chain of stores called "ComputerTown"
that sells nothing but Mac and Mac-related stuff. It recently expanded
and opened its first Non-New England store in Arizona. Macs are for
sales in Sears, Circuit City, and numerous other such retail
establishments, as well as electronics discount stores and office stores
like OfficeMax and Staples.

Of course, you consider success in marketing to be availablity through
the dying retail chain, which is seeing NPV revenue flow DECREASE every
year since 1990. Why? Because consumers are buying elsewhere, and only
a few retailers, specialty ones like ComputerTown, for example, are
doing well.

THERE'S STILL TIME TO GET ATARI STUFF IN TIME FOR CHRISTMAS!!

Our unique selection of Atari hardware and software (Lynx, Jaguar, and
ST!) is the perfect gift for the Atari fan on your Christmas list, and
if
you're the Atari fan, giving hints to the ones you love is certainly
encouraged!!

Here's a list of some of this year's hottest sellers:

LYNX GAMES

Games List & Prices as of Dec 11, 1996

A. P. B. $19.95 NFL Football $39.95
Awesome Golf $29.95 Ninja Gaiden $29.95
Basketbrawl $19.95 Pacland $19.95
Baseball Heroes $19.95 Paperboy $39.95
Batman Returns $19.95 Pinball Jam $19.95
Battle Wheels $39.95 Pit Fighter $19.95
Battlezone 2000 $39.95 Power Factor $19.95
Bill & Ted's $19.95 QIX $19.95
Ex. Adventure
Blockout $19.95 Rampage $19.95
Blue Lightning $19.95 Rampart $19.95
Bubble Trouble $39.95 RoadBlaster $39.95
California Games $39.95 Robosquash $19.95
Checkered Flag $39.95 Robotron 2084 $19.95
Chip's Challenge $19.95 Rygar $19.95
Crystal Mines II $19.95 Scrapyard Dog $19.95
Desert Strike $39.95 Shadow of the Beast $19.95
Dinolympics $19.95 Shanghai $19.95
Dirty Larry $19.95 S.T.U.N. Runner $19.95
Double Dragon $29.95 Slime World $19.95
Dracula $19.95 Steel Talons $19.95
Electrocop $39.95 Super Asteroids/ $39.95
European Soccer $29.95 Missile/Command

NEW JAGUAR TITLES NOW AVAILABLE!
==========

Now available for the Atari Jaguar are TOWERS II and BREAKOUT 2000!

Vince Valenti's ST hit TOWERS II is now available for the Jaguar for
just
$59.95! Available now!!

The all-time arcade classic makes its way onto the Atari Jaguar! Just
$59.95!

Also, buy an Atari Jaguar system with Wolfenstein 3D for just $59.95!!!
It's a FANTASTIC DEAL! Order TOADAY! FULL SELECTION OF OTHER JAGUAR
TITLES
AVAILABLE TOO, WITH SPECIAL PRICES GOOD THROUGH 12/23!!

AMAZINGLY HOT ST STUFF -- PRICES GOOD THROUGH 12/23/96!

This holiday, give the gift of TRUE MULTITASKING with MagiC 5, just
$99.00! Or, give what everyone's after, TRUETYPE FONT MANAGEMENT and VDI
ACCELERATION with NVDI 4!

MAGIC PC SPECIAL! THROUGH 12/23!!
Get MagiC PC for Windows 95 and run ST programs on your PC -- FAST!

It's just $169.95 -- NORMALLY $189.95 -- through 12/23!! Order TOADAY!

MAGICMAC SPECIAL! THROUGH 12/23!!
Why pay more for MagiCMac, the premier ST emulation software for the Mac!
Through 12/23 pay just $169.95 -- NORMALLY $219.00!! SAVE $50.00!! Works on Power PC and 680x0 machines! Also, get POWER PRINT for Macintosh (use any parallel printer on the Mac or with MagicMac) for just $189.00!!

IMAGECOPY 4.0CD!! JUST $49.95!!
The premier image conversion & printing program for the ST/Falcon is still
available! Also available is the ImageCopy 4.0CD upgrade for just $15.00!!

PAGESTREAM!! JUST $39.95!
PageStream, the best, valuepacked page layout & design program for the ST
is just $39.95!! ORDER YOURS TOADAY!

C-LAB FALCON SPECIAL!! THROUGH 12/23!! PRICES SO LOW, WE CAN'T PRINT THEM!
We've got C-LAB Falcon MK-X, MK-I, and MK-II machines, in 4 and 16MB configurations! If you're interested in getting a quote, please call Jennifer at (410) 544-6943! Available with and without Cubase Audio!!

C-LAB FALCON MK-X UPGRADE KITS! JUST $299!! SAVE $100!
Upgrade your Atari or C-LAB Falcon to the Falcon MK-X expandable, sleek black case for just $299! Available through 12/23 for $100 off the regular
$399 price!

ATARI HARD DISK SPECIAL!! FANTASTIC CHRISTMAS OFFER!
OUT OF THE TOAD VAULTS AND INTO YOUR HOME come these fantastic deals on these VERY CUTE, very SMALL hard disk drives for your Atari ST/TT/Falcon.
They are small, portable SCSI drives available for a LIMITED TIME ONLY! BUY NOW AND SAVE! Based on 2.5" SCSI drive mechanisms, they are fast and very reliable!

40mb.....$ 79.00
80mb.....$ 99.00
120mb.....$109.00
160mb.....$129.00
530mb.....$249.00
ICD Link II.....$ 99.00

ATARI SM147 MONITORS -- WHERE ELSE CAN YOU GET THEM?
We still have Atari SM147 14" monochrome monitors available for $199 --- all available in time for Christmas delivery. Nothing else comes close!! Great for musicians! 14" display size makes a great upgrade from the SM124! But if you want the SM124, we still have refurbished models for $99

each!

ATARI TTM195 MONITORS -- WE HAVE THEM!
If you need 19" black-and-white clarity on your Atari TT030, there's no substitute for the ATARI TTM195. We have them NEW for $250(!) and a used model for $150(!!) Get yours while they last!! Only a small quantity remaining!

ATARI STACY COMPUTERS!!
If you're looking for the portable power of the Atari STACY, we have refurbished models available for $999! Don't miss this -- this could be your last chance to get one of these classic machines!

ATARI 1040ST and 1040STE Computers!!
We have used Atari 1040ST computers available for $199 and used Atari 1040STE computers available for $299! New STE computers available too! Call for pricing! Order yours today!

HIGH DENSITY DISK DRIVE KITS!
Buy the best ST High Density disk drive kit now for just $89, including the floppy drive! FANTASTIC DEAL!

FALCON POWERUP 2! GO TO 32MHZ with your FALCON030!
Take your Falcon to new speeds for just $79!! Normally $99! SAVE NOW!!

XTRA-RAM DELUXE FOR ATARI ST!
Atari ST 2/4MB RAM UPGRADE AVAILABLE FOR JUST $49.95! NOW THROUGH 12/23/96! GET IT WITH 4 1MB SIMMS FOR JUST $99.95!! SAVE TODAY! OR GET 4 1MB ST SIMMS FOR JUST $49.95! SAVE NOW!

ATARI ST, PC & MAC BEETLE MICE! Beetle Mouse for Atari ST available now through 12/23 for just $29!! SAVE NOW, ORDER TODAY! PC Beetle Mouse PS/2 or Serial just $20, Mac Beetle Mouse just $20!!

AMAZING CD-ROM SPECIAL!! AVAILABLE NOW THROUGH 12/23!!
Get incredible prices on Atari CD-ROMs published by Toad Computers, now through 12/23/96!!

Bird of Prey.....$19.95
Atari Compendium.....$19.95
Suzy B DOUBLE CD SET.....$24.95

Or get ALL THREE for just $49.95! That's right! Just $49.95 for ALL THREE
CD'S -- this is our LOWEST PRICE EVER ON THIS SET OF EXCELLENT CD's!!

GEMULATOR 96 + MAGIC 2!! NOW THROUGH 12/23/96 JUST $99.95!!
Run your favorite ST Programs on your Windows 3.1/95 machine with GEMULATOR '96 and MagiC 2 -- the first ALL SOFTWARE Gemulator solution. Also works with Magic 4!! Call for more details!!

ATARI PORTFOLIO ACCESSORIES -- GET THEM WHILE YOU STILL CAN!! The Atari Portfolio PC Card drive allows you to read and write Portfolio memory cards using a standard PC! Now just $19.95 -- THROUGH 12/23!! ORDER

TOADAY! Also available: 64K Portfolio Memory cards -- just $9.95!! Order yours TOADAY!

SOUNDPOOL ANALOG 4/8, FDI, and other MUSIC ACCESSORIES! Available at amazing prices through 12/23! Call Jennifer at (410) 544-6943 for latest prices and to order! We also have a full line of Atari music software and
accessories available, at incredibly affordable prices!!

UNITOR MIDI/SMPTE EXPANSION UNITS BACK IN STOCK AT $349!!! Also available
are MO-4 (Midi-out 4 MIDI Expansion), Export, and others! Call Jennifer at
(410) 544-6943 for the latest prices, SPECIAL THROUGH 12/23!!

FANTASTIC ATARI JOYSTICK EXTENDERS ARE PERFECT FOR 1040/FALCON OWNERS! Tired of the silly, under-the-keyboard joystick and mouse ports on the Atari 1040ST/E/Falcon? Well, banish them forever with these simple custom
manufactured JOYSTICK EXTENDERS!! GREAT STOCKING STUFFERS! Just $4.99 each
with any order!

ATARI CX-40-LIKE JOYSTICKS FOR ATARI/COMMODORE!
Still available, these sturdy joysticks are reminiscent of the original Atari CX-40! Just $8.99 each or 2 for $12, these are a fantastic deal!!

ATARI ST CHIPS AND IC's -- AVAILABLE!!

CO25912 MMU.....$5.00
CO25914 VIDEO SHIFTER.....$5.00
CO25913 DMA CHIP.....$5.00
CO25915 GLUE CHIP.....$5.00
WDC1772 DISK CONTROLLER.....$5.00
THESE PRICES GOOD THROUGH 12/23!! CALL FOR OTHER ST PARTS!

ATARI ST MONITOR SWITCHBOXES!! SWITCH EASILY BETWEEN COLOR & MONO!
Great deal! Now switch between color & monochrome monitors, without ripping your back out!! It's just $14.95!! Price good through 12/23/96!

WARP 9 FOR ATARI ST -- NOW JUST $19.95!! PRICE GOOD THROUGH 12/23/96!
LDW POWER FOR ATARI ST -- NOW JUST $29.95!! PRICE GOOD THROUGH 12/23/96!
PRINTMASTER PLUS FOR ATARI ST -- NOW JUST $14.95! THROUGH 12/23/96!
AdSPEED ST/STE -- JUST $99!! PRICE GOOD THROUGH 12/23/96!
MEGA STE/ST/TT030 KEYBOARDS -- JUST $99.95!! PRICE GOOD THROUGH 12/23/96!
HD DRIVER v6 UPGRADE -- JUST $19.95!! PRICE GOOD THROUGH 12/23/96!
CUBASE AUDIO -- JUST $399.95!! PRICE GOOD THROUGH 12/23/96!

Order between now and 12/23/96 and receive a GOLDEN IMAGE BRUSH MOUSE free
-- just for asking!! All you have to do is ask!!

ALL THIS PLUS HUNDREDS OF OTHER ATARI ST/JAG/LYNX ITEMS IN STOCK, READY
TO
SHIP TODAY, IN TIME FOR CHRISTMAS DELIVERY!!

Ask about our great prices on PC systems, too!!

IF YOU CAN WAIT TO ORDER, YOU'LL PAY MORE IF YOU DO IT AFTER 12/23/96!!

Hi Again Steve,

Jedi made a comment that seems to indicate professional software does not exist for the Atari any longer. This is simply not true as I can name a dozen new high end publishing and office tools released in the last year.

The withdrawal of Atari from the market has not affected sales in any way, we still survive on sales of Atari product 100%, with the exception of MagiCMac if you consider that to be a mac application.

All the best,

Chris @ Computer Direct

What components are you refering too? And you get more performance from
a 604 at 120MHz than a pentium with the same clock speed.

> I'll believe it when I can buy it. Empty promises and vapourware
> mean nothing to me. We were supposed to be able to run x86 software

What number of you using for the cost of X704 computers and were did you
get those numbers? Similarily, where did you get the X704 SPECmarks and
why do you consider them disappointing?

Hi Steve,

What you saw is not an illusion, it is a true representation of the speed that you can expect in MagiCMac.

MagiCMac is written in highly efficient machine code and takes advantage of the processing power in that Mac. The MacOS on the other hand is very slow and sluggish in direct comparison.

The other thing to remember is that all Atari Apps are also written in highly optimized code and execute and run much faster than Mac apps. They
are also designed to run on our lowest common denominator machine, a 68000 8MHz 16 bit computer with 1 MB of RAM. Given this hardware limitation one can quickly see why the software runs so fast when used on a powerful processor.

If you want more info on MagiCMac, see our web site.

There are many excellent, low cost apps also available and info is also available on our web site.

All the best,

Chris @ Computer Direct

http://compdirect.com

ps> I forgot to mention that MagiCMac is a true 32 bit pre-emptive multitasking OS with adaptive prioritization and memory protection.

Six time as fast? Who is this really :). On my much more dated machine,
MagiC Mac indeed runs much faster than the Mac O/S. As you have no
experience with Atari computers, a compairson is not important. What
is, is the fact that you have found a more efficent operating system
for your (all) Mac's and feel the need for speed.
With what you said about "keeping in mind", if you spend the time
finding "Atari" applications that fit your needs, you will end up with
much higher computing performances in all areas. There are many "Atari"
applications that perform the same function as those available on the
"Mac" platform. Down the the last one, you will benifit from the "speed"
increase over the Mac O/S side of your computer.
It is even hard for users of "Real Atari" machines to believe it when
they see it.

Oh, I see, so the BYTE study is wrong. And that Performa 6400/200 is
really MORE expensive than the Aptiva. I guess some malicious bastard
at Computer City switched the price labels again, eh? :')

I suppose I would be the youngest diagnosed case of Alzheimers in the
history of the US if I was, but realistically, I remember no committment
to "full-speed emulation." The committment was to speedy emulation (ie,
a PowerPC emulates a Pentium a helluva lot faster than a Pentium
emulates a PPC), and to Windows NT on PPC. One is here, the latter is
in development.

Apple's vision of RISC was to provide users with a more powerful system
than the competition could offer. Apple succeeded, as BYTE's study of
PowerPC chips demonstrates admirably. PowerPC Macs blew the doors off
of comparably priced, comparably equipped Pentia in all areas. I hardly
call that "welch"ing.

> computing.

I see, so there are more hardware platforms available than the ST,
Amiga, Mac, and Windoze with some semblance of vendor application
support. Oh, forgive me, I forgot the cobble-it-yourself Linux system
(no applications, few vendors); the Atari 400/800/XL (Computer Dungeon
still services them, at least); the Commodore 64 (discounts on
Ghostbusters at K-Mart!); the Timex Sinclair (great little machine), the
Coleco Adam (dot matrix printer included!), etc.

No, I'm talking about machines which reached some semblance of market
acceptance. This is required to get tools like Internet software,
decently-supported word processors, spreadsheets, financial accounting
software, and other such applications the world needs to revolve
around. For that, only the four aforementioned systems meet the tab.
The former two are fading fast. That leaves the latter two in control -
and if open standards are not adopted by the market, the chance of
success for Be and other new entrants is decidedly slim.

The market has never been at a more crucial crossroads.

The fact of the matter is, unless some development direction is taken,
the TOS OS will not be a contender for mass-market approval. And that
is what is needed to continue getting useful applications. If the TOS
market was rosy, with great sales, you wouldn't see ASH, HiSoft, Oregon
Research, etc. halting development and scrambling for other platforms.

I see, and what OS would that be? TOS? If so, I use it too. Got news for you. Very fast, very efficient, still some development. But support is fading every day. And in some key areas that I needed tools in, I couldn't get them. That's why a Macintosh sits next to the Falcon030 on my desk. (Interesting how you assume I don't own one simply because you hate to see the reality of the situation.)

It remains common knowledge that retailing is a shrinking portion of the economy, and continues to shrink. In addition, interestingly enough, CompUSA has been doing so "well" that it has begun a MAIL-ORDER program instead of opening additional stores. Why? Because revenues per square foot are below expectations. Not healthy.

Hmmm. . . JCPenny's is doing well, eh? Could have fooled me. And WalMart? Hardly a retailer - more like a discounter. And a rarity in the large store marketplace right now.

Regardless, it has been more than sufficiently proven that measuring success through retail availability is a 'dinosaur from the last century.'

Yes it is, but if you measure "success" through retail availability,
Sears is the best darn example of "retail availability" on the planet.

> $>establishments, as well as electronics discount stores and office stores
> $>like OfficeMax and Staples.
>

> They have also shown a decline in Mac floorspace as well.

In computer floorspace, as well. Since Apple consolidated Performa into
three variations, there is need only for three kiosks. But at the
original Staples in Framingham, MA. Mac floor space and software space
is growing. And the Staples in Natick gained a Mac display for the
first time, displacing those horrible word processing machines (does
ANYONE buy those anymore?).

>a 604 at 120MHz than a pentium with the same clock speed.

That might mean something if you could get a 604/120 machine
for $1400 but, you can't (at least not from APS). The $1400
APS machine touted by you is a 160Mhz 603e based machine. It's
a nice attempt but not entirely competitive. This is even while
ignoring the 'El-Cheapo' clones that frighten MacVocates so.

As far as PC components go: Intel Controllers, ATI 3D graphics chips,
Creative Labs multimedia, Western Digital
PIO Mode 4 (faster than SCSI2) drives &
other big brand brand name items.

APS Tech's only advertised 604 based system was $2600.

It also supports newer better CPU's natively than just 'ye olde 68000.
And the newest MagiCMac version also has some PPC-native routines.

> Take that level of efficiency, and then apply the power of a more
> contemporary machine to it, and the effect you've produced should
> not be at all unexpected.

Yes, but why should it be otherwise anyway ?

> Available apps will be limited however. Atari is an orphan.

Yes, but it has "foster parents" like C-Lab and Medusa Computer Systems, both
do various Atari-clone computers. And believe me, they wouldn't be doing
them if it wouldn't be worth it in terms of demand.

> However,
> unless you have some pressing professional need, this should not be
> too much of a problem.

Ahem! This "pressing professional need" can most certainly be satisfied with a
program like CALAMUS SL, which I personally think is much better (and faster)
than PageMaker and QUARK XPress - In terms of typography of course.
And CALAMUS SL runs just fine under MagiCMac.

Anyway running MagiCMac can be seen as an alternative to MacOS, without having to
bypass MacOS. MagiCMac can work as an intregrated unit running fast programs
along with MacOS programs. Use a program like CALAMUS dtp under MagiCMac
along-side with PhotoShop under MacOS and share the files. Many people
do that and it proves to be quite a powerfull combination.

It's just too bad that so few Mac-owners actually knows about MagiCMac,
it could be quite a powerfull system enhancement for their machines and
it would make the MagiC/Atari market grow.

Keep Cool and Flying...

You can also "roll your own" 604 box (like most PC advocates like to)
with Motorola-based motherboards and such. Check the latest Macworld -
they were listing $2000 for a 604/200/32 with a 2 gig hard drive, roll
your own.

Incidentally, the APS clones are a fantastic buy. 160 MHz is plenty
fast, and puts easy-to-use computing with a consistent interface and
more-refined products in the hands of those who have had enough of
defective PCs from Packard Bell and Gateway (oh, the stories I have from
experience with THOS two!)

> As far as PC components go: Intel Controllers, ATI 3D graphics chips,

Uh-huh. Your point is?

For real throughput (ie getting useful work done), any modern Macintosh
is fully price and speed-competitive with a comparably-priced PC clone.
And in many areas, the system integration is 100 times better.

Just try having a layman install RAM, add an Ethernet adaptor and
internal CD-ROM to a PC clone. See what happens. I have, and it ain't
pretty.

It would be a cheap solution to Apple's current OS woes as well (using a MagiC kernel to replace MacOS). It would probably be more compatible than BeOS, and would offer many developers on the Atari side a platform to develop for that is growing.

A side benefit would be the simultaneous deaths of Jedi and Peter Sinclair-Day. Why, can you imagine Peter's reaction when Apple goes to TOS for kernel salvation? Or Jedi's response to the establishment of Macintosh as the TOS platform of the 90s? Level 25 apoplectic seizure, anyone? <grin>

This is no problem. I recently purchased the Amiga A4060T alluded to in my sig. I like exciting computers, whether they're orphaned or not. :>

In article <595k5s$ecc@scanner.worldgate.com> Chris Krowchuk wrote;

>>What you saw is not an illusion, it is a true representation of the speed that you can expect in MagiCMac.<<

Very cool!

{much worthwhile info snipped}

>>ps> I forgot to mention that MagiCMac is a true 32 bit pre-emptive multitasking OS with adaptive prioritization and memory protection.<<

Memory protection? Damn, this sounds better all the time. BTW, I visited your website. You'll be hearing from me, though it may not be until February before I can make purchases (the Amiga needs a monitor and a CV64/3D card <g>). I'll definitely be purchasing NVIDI with any package I put together.

In article <32B68402.665B@ridgecrest.ca.us> Michael Grove wrote;

>>Six time as fast? Who is this really :).<<

I really am just a Mac guy who ran this demo, and was mightily impressed. Honest.

Please excuse this weird posting -- I figured I'd do it this way instead of providing three separate ones. Also, please excuse the oddball quoting method -- the AOL newsreader leaves something to be desired in this regard. :>

I should mention that after I demoed MagiCMac I went searching for a review of this OS in MacUser and MacWorld. There were no articles dealing with it, even though it appears to have been out for a little while. I'll send letters to both magazines suggesting they offer a review. It seems an awful shame that a ready OS with so many features and so much speed, not to mention a useful number of apps, should remain unknown. The way I figure it, this could delay my need for a hardware upgrade for at least a year!

Thanks to all for answering my questions. It really has been a big help.
:)

Best;

>reflect this speed as well.

Well, Atari apps are considered fast when ported to OS/2 (papyrus, a
word processor), why should they be slow on a much faster 604 PPC?
They are usually optimized to run acceptably fast on an 8 MHz 68000,
most run quite great on a 32 MHz 030 (MPEG players require more
power, of course).

Of course, a PPC POVray will always be faster on a PPC than a 030
POVray, but for text editors, word processors, etc., the impression
you got was correct.

I wouldn't consider Shockwave to be much of an asset - I mean, come on!
On my Mac, I have allocated ELEVEN MEGABYTES of RAM (silicon RAM, not
VRAM) to Netscape with Shockwave extensions. And I _STILL_ suffer from
"out of memory" errors when I try to, say, visit a basic web page and
read news at the same time. It has sent me running screaming to
Cyberdog (which only takes about 1.4 megs of RAM).

Also, on a 28.8 connection, Shockwave is an abortion to wait for
loading!

> That is not what you originally posted.

Of course, but it is an option frequently put forward by PC users. . . A
copy of MacUser or MacWorld reads much like a clone mag these days
because of the huge content of advertisements for clone systems.
DayStar, Motorola, APS, Apple, Power Computing, UMAX, and a number of
smaller companies are all making Macintosh compatibles or offering "roll
your own" systems. And prices are plunging on all models.

> >with Motorola-based motherboards and such. Check the latest Macworld -

> >your own.
>
> Spend that much on a PC of that calibre and you don't have to roll your own.

A "PC of that calibre" would cost considerably more, simply because of
the slow speed and general inefficiency of the Pentium. It would
require a Pentium system running at a 20 to 40% faster clock speed to
equal it.

The best PC for $2K I could find (quality PC, that is, not Packard
Bell) was a Sony AVIO at COmputer City. I was far from impressed.
Incidentally, it was a Pentium 166.

604's outperform Pentiums at equivalent clock speeds on all levels.
What this basically translates to is that in all cases, a high end
Macintosh system will outperform a high-end Intel system, and that in
order to move low end boxes, they have to be priced quite low (with
faulty components). Take a look at a Packard Bell's repair rate (or a
Gateway's for that matter). I have horror stories in corporate settings
about both. As usual, the adage is - you get what you pay for. And
they really do make it up later. Ever try calling 900-number tech
support?

> case that can accept another removable media device.

Depends upon what application you are talking about, how much experience
you have, and what you seek to do.

A $1,000 Packard Bell is cheaper than a $1,499 Performa 6360. But with
the 6360, you get quality construction, toll-free tech support, and a
host of USEFUL programs (like ClarisWorks).

With the Packard Bell, you get a system that is virtually guaranteed to have a major failure that renders it inoperative in a year. You also get a system that is less expandable and made obsolete far sooner than a Macintosh.

Your claim about Mac clone "stripping" is actually an apt description of Packard Bell and MOST bargain-basement PC clones. Ever try to replace the sound card, install SCSI, or add a CD-ROM on one of those? Most require HUGE expenditures in additional hardware because of their "bargain basement" rankings. Their quality is unacceptable.

An APS low-end Mac clone includes 16 megs of RAM, 16 bit stereo sound, keyboard, mouse, a 1.2 gig hard drive, a 160 MHz 603e, IDE and SCSI, ability to use a VGA monitor and PS/2 mouse ports. Hardly a "strippo" system.

Another thing you get with Mac? Real multimedia that's easy to use. PC multimedia is many years behind, unrefined, and a hodge-podge of BIOS-conflicting, IRQ-confusing, expensive, poorly-supported hardware and software. And since multimedia is what many people aim for (even if merely for games), people again get what they pay for.

The multimedia capabilities of that $1,499 Performa 6360 or $1,399 APS blow the $1,299 Packard Bell out of the water.

> Configurability is a triple edged sword.

Yes, it is. Unless you have a Mac. Then, you just plug in the card, install the driver, and go. No "Plug and Pray" like what they typical Windows 95 user experiences. You spend less time installing, and more time working.

And if you do have a problem, Apple doesn't charge for tech support. Microsoft and most clone makers do, directly, through a 900 number, or indirectly, through toll calls (assuming you don't get put on hold for a year.)

You get what you pay for.

> RAM is just a matter of plugging it in. This is no different be it
> Atari ST, Mac, or PC. If they would have problems with this task
> on a PC, they would fare no better with any other machine (mac incl).

Not hardly. A client of mine had purchased Gateway computers (a bank of them) and installed them (all four) in a 10-Base-T network running Windows NT server and Windows NT workstation. The setup was designed to run SBT Accounting software exclusively.

After suffering from numerous memory problems (the machines ran out of memory, only 32 megs on each "dumb terminal workstation" and 64 on the server), we determined we had a defective batch of machines. Gateway had to be screamed at, while we were down for over two weeks. Finally, the PCs were replaced.

I went to install the new SIMMS in the server (to upgrade it to 128 megs), and couldn't get it to work. Why? The BIOS had to be put through some sort of arcane process before it would recognize the new RAM. That network had so many problems that they ended up hiring a seperate hardware consultant, and, I understand, purchased a new server. Not a glowing endorsement of PC technology.

In a Mac setting, the systems could have been installed by an entry clerk, with minimum help from me. Even if they had gone for the most expensive, least-cost-effective Mac systems, they would have saved tens of thousands of dollars in downtime, new hardware, and consultancy fees.

> Jumpering an IDE drive to master is much like terminating a SCSI dev.
> Plugging in the power is much the same.
> Mounting it in the case is much the same.

Yeah, it's real simple. Just make sure that the BIOS is properly booted. Type AN$1 when the BIOS prompt loads. This takes you to the IRQ layout screen. Write down all the IRQ numbers. Tear out hair. Try various mixtures of IRQ numbers until you find the problem. Spend about four hours doing so. Assign new numbers that Windows NT 4 will find acceptable. Tear out hair. Reboot. Get new driver from hardware maker because it won't allow reassignment. Tair out hair. I've been through all this before, thanks. It ain't Plug and play, no matter what Bill Gates dreams it should be.

> Without more specific details, your anecdotes aren't even that.
>
> Some people have a knack for making their lives difficult no matter
> what they're using. Others merely don't let the machine intimidate
> them and just follow the instructions.

I follow(ed) the instructions, all right. Too bad they charge for the English translation. And any tech support. After all, if you were a clone maker, with razor thin margins after you gut all quality components out of your machine - would you want to stand behind your product? I would - as far behind it as possible.

I see. That's why InfoWorld, BYTE, and even Intel concur that the 604
is more efficient?

Regardless, the performance (and quality) edge is there.

I am someone interested in using tools and telling other people about my
experiences. And I am tired of seeing Atarians manipulated and lied to
by others. Fact of the matter is, if a TOS user is considering a
migration, a Macintosh will fit expectations and experiences better than
a PC. Period.

Nice try. The industry was thrilled over PowerPC for the same reasons
they were thrilled over the ST and Amiga - it was exciting, new
affordable technology that offered a huge leap over the moribund,
boring, pushed-to-the-limit technology being foisted upon them by other
companies at the time.

> Aftermarket software emulation solutions are nothing to hype.
>
> Even the lowly ST has those. SoftWindows being PC-Ditto95 is

Except that there is no PC-Ditto 95.

> Actually, although not fully supporting System7, Executor does in
> fact support Mac hardware with a greater degree of efficiency that
> Macs support PC hardware.

Hmmm. . . wonder if a Radius NuBus card would work in a PC? And of
course, the PowerMac version of Fractal Design Painter would smoke,
right? Oh, forgot, FDP requires System 7, and Executor only runs MacOS
6 with 68000 emulation. . . A slow Mac Plus!

On the other hand, I have Win95 running fine (as fine as it can run)
under SoftWindows. When I'm required to run legacy Windows
applications, I've got it available.

>

I see. Which would those be, Alphas? Intel sure isn't offering a
Pentium that goes that fast. And the Tanzania boards by Motorola and
Apple's upcoming machines will run 604s at 500 MHz. You can even
purchase 604 accellerators today that do 300 MHz.

Oh, and also, from experience, Alpha AXP workstations have LOADS of NT
applications written for them. I'll bet I've run all three of them in
the store!

>

> >call that "welch"ing.
>
> The only time macs blow the doors off of PC's is when the Macs
> in question cost several times more.

Seems you could use a similar argument for the Atari 800 - the only time
PC's outperformed an Atari 800 was when they got to 386 levels with 16
bit SoundBlaster cards. Thus, a PC clone is a poor investment, and the
Atari 800 is a better buy.

You also ignore the fact that mainstream people want to get work done.
A Pentium PC is like a Camaro Z28 with a stripped tranny. Sometimes it
works quickly, but it's in the shop a lot, and costs a lot to maintain.
And it's been proven, time and again, that professional (and personal)
environments running Windows (95 or NT) suffer from greater downtime and
are generall less productive than Macintosh environments. You buy a
computer to get work done, not just to impress the neighbors.

And too bad that, finally, Macintosh is undeniably faster at the high
end than any Intel box, and a better value at the low end.

A PC is a step down from an ST, not a viable migration option.

You do that. While you're doing it, please call Diamond Multimedia and get me their latest Linux drivers, and Creative Media as well. After that's complete, give me a call back. I expect you won't be calling.

> BTW-Linux runs SCO binaries. If you had the slightest idea
> what was going on, you would realize the significance of that.

Ah, the Santa Cruz Operation - a blast from the past. They're giving away Xenix for free, now that Linux is out there. Too bad that neither has substantial market acceptance, major applications, technical support, or any sorts of creative tools. It's hardly an option for any but the most computer-nerd oriented. No typical small business or individual would benefit from a Unix system. The only people who would are the consultants who charge to keep the system current.

> You are seriously attempting to criticize the Internet software
> availability of a Unix variant? Go crash your Mac or something.

Absolutely. Where can I get a fully graphical compliant HTML program, with support for Quicktime multimedia and all the other jazz my clients are looking for, under Linnux? How much will it cost? Can I get tech support? Is it updated?

I don't recall mentioning UNIX in the above post, either! Seems like literacy criticisms are misdirected! UNIX is not a mainstream, mass-market system. It is an OS for hobbyists, academics, and IS-types in large corporations. It is expensive and poorly-supported, as well as available in a range of non-compatible configurations. Hardly a decent choice for small business or the individual.

> >decently-supported word processors, spreadsheets, financial accounting
>
> Linux is supported by Unix vendors, big surprise.

Wow! You can run TeX on it! And you can pay $7,000 for a copy of FLORCON! Real alternative to the Mac, there!

Actually, I would agree with you there. But what it needs to succeed is
an integrated, fully graphical, consistent interface, provisions for
multimedia, and support (RABID SUPPORT) by a computer maker to succeed.
Without these, it is another NeXTStep.

> It will continue to exist and grow
> regardless of the marketplace.

But so will TOS systems and Macs. And both are more mainstream, have
more software, and more support.

> It is quite independent
> of it. There are no Tramiels that can destroy it.

Always a good thing - but I don't think Tramiels succeeded. Otherwise,
I wouldn't run MagiCMac.

> IT
> may take quite some time for Linux to be palatable to
> the masses.

Actually, not really. The next big computer format will be that which
appeals to small business and entrepreneurs. One that offers bang for
the buck. And one that runs on RISC (which precludes all current
generations of Intel processors).

However, Linux has all the time it needs.
> It is not tied to one particular set of hardware or the
> fortunes of one particular corporate entity.

True, but it needs the support of sizable corporate entities to
establish the reseller presence to succeed. It would be interesting to
see how the Internet comes to bear in this. It also needs to be easy to
use, which it is decidedly not, unless you like grepping. "What the
hell is 'grepping'?" is the response from the typical computer user.

Hmmm. . . that's interesting. From 1985 to 1989, I remember a market craze which placed Atari at the forefront of technology. I remember a day when Microprose, Sierra-On-Line, WordPerfect, and others supported the ST with regular releases. I even hear that the ST kinda sold okay in Europe (you know, that #1 selling system designation).

Whoopee. Not mass market, not a realistic solution. It lacks the API, interface, and applications (dare I be P S-D and say apps?) that the market requires. Thus, it is not a realistic option.

Nope, a person who appreciates elegant, usable, cost-effective tools. And someone who has to recommend solutions to others (I have completely gotten out of the PC business because I could not ethically justify recommending WNT4). What I do know is that in the creative areas (like

my fairly successful Web business), Macintosh computers dominate and
have an unmatched tool-set.

Linux and Windoze don't. TOS doesn't.

Service Merchandise? Another company with failing financials. Lee
Wards is not a national chain, at least not one with stores in New
England.

> Furthermore, 'below expectations' != 'unprofitable'.

Yes. In Finance, there is the concept of the "discount rate" - ie, $1
today is 38 cents ten years from now. When cash flows do not meet
expectations, net present value of stock declines, shareholder value
declines, and weighted average cost of capital increases, constricting
ability to make further expenditures. That restriction leads to greater
decreases in revenue, further constriction, and, well, you get the
idea. See "Commodore International, Ltd. - 1992 to 1994" for more
detailed results.

> That they failed to accurately predict how much space they

No, CompUSA still advertises. :')

>
> Other retailers are expanding at this time. (Sun,Microcenter)

By and large, though, the retail establishment is dying.

> >
> >Hmmm. . . JCPenny's is doing well, eh? Could have fooled me. And
>
> Their last quarter profits were up ~30%.

Net income was up, but stock prices weren't. You know why? Cash flow from operations was below expectations. Something that amuses and amazes me is the fixation of net income figures. Cash flow is the measure that the market uses to determine present value.

>
> >WalMart? Hardly a retailer - more like a discounter. And a rarity in

>
> Typical Macvocate attitude. If it is in-expensive, it is somehow
> beneath us. 'Discounters' have been around as long as 'retailers'.
> Walmart != Odd Lots.

I see. Would being a "Macvocate" be similar to being, say, a Jew? Well, hey, the reason I asked is because both labels have been used against me in a negative fashion, assigning me beliefs that I "supposedly have", which assigns me a certain IQ level, and validity. I hardly consider either context to be intellectually becoming or socially acceptable.

Now that we have that out of the way, let us discuss the difference between "retailer" and "discounter." A "retailer" sells specialty goods at substantial markup, with a clearly-outlined marketing strategy. A "discounter" sells a variety of products, whichever it thinks it can sell profitably, with minimal markup, and pursues a price-oriented marketing strategy. Hence the reason that Walmart/K'Mart/Ames/TJ Maxx advertise "we have really, really low prices on everything you want," while Neiman Marcus advertises using those artsy jazz commercials.

>

> themselves?

It's not all moving to mail order. . .

Actually, the PC market has moved, to a large extent, to mail order. What makes mail-order PCs sell? I think you can figure that out. Just call Gateway or Dell and ask.

> Computer Shopper doesn't even seem to have any Mac Clone ads.

Computer Shopper is a PC-oriented rag, and hasn't covered Macintosh with any detail since it dropped Apple II, ST, Amiga, and Mac coverage in 1991.

> What is visible to most customers in most of the US is a lone
> brand of Mac drowining in a sea of PC clones.

Then they buy them, and discover the "joys" of daily use. Then the PC goes in the closet, or collects dust, or little Billy uses it to play Doom on and subsequently flunks out of middle school. Sounds rather prejudicial, no? Same with your statement above.

Mac vendors are
> not doing enough to convince anyone to go against the
> lemming tide.

I agree, but most are still young companies. They are growing, their marketing budgets are burgeoning, and Motorola is even convincing its Windows NT customers to switch to MacOS. The reall battle is at the creative and small business levels, and on both these fronts, Apple itself is putting on a formidable battle.

I also remember all the hype about IBM "dying" in 1991. Seems to me that the IBM brand, along with Chrysler, International Truck, and American Airlines have all faded into the night because of consumer perceptions generated by ill-informed media spinning. Right?

The Mac version is REALLY buggy, and I suspect that SoftLogik is running low on financial resources. It never had THAT many to begin with, and abandoning the platform that provided it with 30% of its business (TOS), it couldn't have helped itself too much. . .

Also, the situation in the Amiga camp is a tragedy of errors. Seems ESCOM, the company who bought Commodore a full YEAR after Commodore went broke (ie, no development or availability of Amigas for a year), has filed for bankruptcy. No real R&D had been in place at ESCOM to speak of, either. Amiga 1200s and 4000Ts have been sold at the same prices they were in 1992. There's no Amiga PowerPC OS, and availability of machines is dwindling. No R&D is being conducted, and another bidding war has broken out for the Amiga operation. VISCorp (a set-top box company) wants the tech for set-top boxes, and claims to have interest in developing computers (yeah right). Apparently, it's financial backing for a bid has fallen through, and now another gaggle of obscure companies is bidding for Amiga.

Maybe in ten years, we'll see a PowerAmiga, considering the on-again, off-again R&D status. . .

Well, regardless, I'm sure this has hurt SoftLogik as well - lots of Amiga owners have jumped ship.

I admit it, I broke the NDA myself. As long as I've broken it, I might
as well mention the rest of the info I know. Apparently, Jack Tramiel
got a job at Apple, and appointed Sam T. as director of public relations
for new OS development. Hence all the success with Copland and OS
public relations as of late. I understand Sam may move up to director
of Press Relations for all of Apple, to reassure investors that Apple
stock really is a bad deal, and to sell it off, so the T. family can buy
it. And Irving Gould is now heading up PowerBook development, and was
the man responsible for the fast time-to-market of the PowerBook 5300's
revolutionary lithium-ion battery system. :') It even doubles as a
portable hand grenade - the Urban Macintosh! (R)

All the above is a joke, don't want to start any rumors. :')

Ahhh, www.intel.com - a great source for non-biased information. And
using the IBM AIX terminals to measure clock speeds - pure genius!
You're great at bending the rules to fit your wishes!

Let's see the numbers for DayStar, and Apple high-performance computers
and compare again. And compare processors to processors, not IBM
computers to Intel processors.

BR Miller
Boston, MA

And really, in that large load of extraneous material, you could have
found something a little more recent. The MPC 601 is old hat.

Intel Alder PentiumPro 200 256+8/8 8.09 5.99 Jan96 www.intel

THESE numbers would suggest otherwise.

/***/
[file edited for brevity]

SPECmarks for various machines

$Id: spectable,v 5.92 1996/12/05 14:58:41 jdd Exp $

What this is: A file of reported SPEC CINT/CFP benchmark results (means only)
for various machines. These figures are generally taken from
numbers published on the net, or in manufacturer press releases
or reports.

This file is organized into eight tables, the first reporting SPECint_base95
and SPECfp_base95, the second reporting reporting SPECint_rate_base95
and SPECfp_rate_base95, the third reporting SPECint95 and SPECfp95,
the fourth reporting SPECint_rate95 and SPECfp_rate95, the fifth reporting
SPECint_base92 and SPECfp_base92, the sixth reporting SPECint_rate_base92 and
SPECfp_rate_base92, the seventh reporting SPECint92 and SPECFP92, and the
eighth reporting SPECint_rate92 and SPECfp_rate92. SPECmark89 (obsolete) is
no longer reported.

There are no chip-only entries (as opposed to systems with those chips in
them); SPEC CINT95/CINT92 CFP95/CFP92 are suites of component-level
benchmarks that measure primarily the performance of a system's processor,
memory architecture, operating system and compiler. Reporting SPEC results
for a chip alone is misleading.

Some specrate numbers have been computed from reported specint/FP92 numbers
for various uniprocessor systems. These are indicated by a trailing "c".

Manufacturer estimates, or estimates of any sort, are not normally reported.

This file is available via anonymous ftp from ftp.cdf.toronto.edu in
the file /pub/spectable.

A SPEC FAQ describing the SPEC benchmark suite and the SPEC consortium is
periodically posted to comp.benchmarks, and can be found on the WWW at
"http://www.specbench.org/spec/specfaq.html". I strongly recommend reading
that document before using these numbers.

More SPEC-related information is available at the SPEC WWW site,
"http://www.specbench.org", and at the Performance Database Web site,
"http://performance.netlib.org/performance/html/spec.html".

Note carefully: benchmark results depend not only on processor type, speed,
and cache size, but compiler, OS and other machine characteristics that are
not reported here. In particular, the compiler can have a significant effect.

Quote:
" While no one benchmark can fully characterize overall system
performance, the results of a variety of realistic benchmarks
can give valuable insight into expected real performance. "
- SPEC newsletter.

Disclaimer: These numbers have not been verified. Nobody guarantees
their correctness, and there is no guarantee that they
accurately reflect the true performance of these systems.
Furthermore, this is not a publication of the SPEC consortium
and is not endorsed by the SPEC consortium in any way.

Please send all corrections, updates, and new entries to jdd@cdf.toronto.edu.

I suspect they're trying to liquidate their remaining inventory without too much of a loss. Now that they're in the PC business, all that old ST equipment is taking up room and costing money to store, heat, and air-condition. If you mention prices, they'll probably come down.

I thought STeve Kipker's STeve's Atari Sales was the last Atari-only bastion, but even STeve has been forced to go Macintosh. But he hasn't made the intimations that he is dropping TOS support (like Toad has).

We set our prices based on two basic principles: supply and demand. In our experience the prices on that equipment are agreeable to the people who buy it, hence their inclination to purchase.

With all due respect if you would like us to lower our prices, you will need to either increase supply or decrease demand. :)

Please explain to me why it is impossible to implement sockets in the MacOS.
It is interesting that you consider application implementations of network
services inferior to operating system implementations. IRIX and SunOS
implement sockets as a server (which is just a special kind of application)
while the MacOS does implement networking at the operating system level.

>And by the way CAB is getting better and better by the week. In fact the only

What is it that you like so much about BSD-sockets? There are other ways
of handling multiple clients by listening on a single port. TLI springs
to mind. Do you like something else about them?

Calamus is a joke. It combines difficulty of use with a lack of proper
PostScript support. Nuff said.

Even PageStream manages basic PostScript support.

Pagestream is very nice. I was managing 2540 dpi Linotronic output with very nice Adobe Postscript display and text fonts mixed with imported and PGS graphics several years ago. I did several major projects. Everything worked flawlessly! I still use it for hospital forms.

I wonder what happened to the fall '96 release of PGS for the PC line? I think (not sure on this one) that PGS was released for the Mac and, of course, there is still a strong following among the Amiga users.

I know this is advocacy, but I am not really "flame" hunting. Just thought it would be nice to "mention something nice" for a change.

Around here at places such as OfficeMax, there is a slight bit
of space for mac hardware and a conspicuous lack of Mac peripherals.
OfficeMax here doesn't even bother to carry the SCSI Zip100 and
it could even be said to be a cross platform product (and not just mac).

Not to mention the cloners. OfficeMax here even has Cyrix-centric
clones from who knows where (very generic). Everywhere customers
can look around here Mac dominates. In some respects a Mac user
would be not unlike an Atari user (in these parts).

Toad vs. MacMall.

Well, of course it does. You haven't loaded it down with other crap
yet. Excepting excessively bad implementation, any minimized solution
should take less space than a rather maximized and bloated one.

Oddly enough, however, such a beast has no problem on the 'other'
machine. Netscrape+Shockwave+5 or more other open applications at
once manage to function adequately in only 8 Megs of physical ram.

Although, if you're still creeping about on an analog modem, there's
no sense in even looking at shockwave yet. Nevermind that I've yet to
see a compelling application of it (T1).

No one who understands computer architecture takes them seriously.
They're about as useful as an SI rating. SPEC, on the other hand,
uses code more resembling actual applications. Furthermore, the
test bed machines for both processors more closely resemble each
other sans processor. SPEC does quite a better job of isolating
other factors besides the CPU that might effect system performance.

What performance advantage a Mac may have over a PC is most probably
due to memory architecture & not the CPU.

>in development.

If that was all that they were promising, then the industry should
have let out a collective yawn. For what they were promising was
trivial and already quite commonplace in some areas.

Aftermarket software emulation solutions are nothing to hype.

Even the lowly ST has those. SoftWindows being PC-Ditto95 is
nothing special at all.

Actually, although not fully supporting System7, Executor does in
fact support Mac hardware with a greater degree of efficiency that
Macs support PC hardware.

>
>Apple's vision of RISC was to provide users with a more powerful system
>than the competition could offer. Apple succeeded, as BYTE's study of

WRONG. The competition can offer 500Mhz NT workstations.
Apple isn't quite up to that yet. The competition can also
offer SMP solutions that will actually take advantage of
multiple processors as opposed to that joke which is DayStar.

>PowerPC chips demonstrates admirably. PowerPC Macs blew the doors off
>of comparably priced, comparably equipped Pentia in all areas. I hardly
>call that "welch"ing.

The only time macs blow the doors off of PC's is when the Macs
in question cost several times more.

Linux is not a commercial venture. For that very reason
it has potential. It will continue to exist and grow
regardless of the marketplace. It is quite independent
of it. There are no Tramiels that can destroy it. IT
may take quite some time for Linux to be palatable to
the masses. However, Linux has all the time it needs.
It is not tied to one particular set of hardware or the
fortunes of one particular corporate entity.

>foot are below expectations. Not healthy.

A Service Merchandise or Lee Ward's model might actually be a good
one. I wouldn't expect a new user to trust some unseen entity with
a costly system.

Furthermore, 'below expectations' != 'unprofitable'.

That they failed to accurately predict how much space they
should use for their rather specialized store does not negate
the concept in general. Perhaps the Tramiels are now running
CompUSA... '-)

Other retailers are expanding at this time. (Sun,Microcenter)
It may be folly but, it is happening nonetheless.
>
>Hmmm. . . JCPenny's is doing well, eh? Could have fooled me. And

Their last quarter profits were up ~30%.

>WalMart? Hardly a retailer - more like a discounter. And a rarity in
>the large store marketplace right now.

Typical Macvocate attitude. If it is in-expensive, it is somehow
beneath us. 'Discounters' have been around as long as 'retailers'.
Walmart != Odd Lots.

>
>Regardless, it has been more than sufficiently proven that measuring
>success through retail availability is a 'dinosaur from the last
>century.'

Still, if the market is all moving to mail order, then why
aren't any mac mail order vendors making their presence
known outside of those who would make efforts to find them
themselves?

Computer Shopper doesn't even seem to have any Mac Clone ads.

What is visible to most customers in most of the US is a lone
brand of Mac drowining in a sea of PC clones. Mac vendors are
not doing enough to convince anyone to go against the
lemming tide.

Does it matter? NO!

Most home users don't have the network bandwidth to useably
utilize most of the much harked upon 'plug-ins'. Shockwave
is no exception.

When cheap home network connections can manage effective thruput
of 100Kbps or more, then lack of Shockwave support might be a valid
gripe.

Atarians, try this shockwave out if you can, I suspect that very
few of you will be impressed.

I wonder how much of this shockwave stuff could be implemented with
Instant Graphics or an enhanced version thereof? Tcl/Tk might even
be an improvement...

>Uh-huh. Your point is?

You were ranting on about how 604's outperform pentia.

Comparing the performance of a $2600 machine to a $1000 one
is hardly fair. Unless the more expensive vendor is ripping
you off, you should expect more.

>
>For real throughput (ie getting useful work done), any modern Macintosh
>is fully price and speed-competitive with a comparably-priced PC clone.
>And in many areas, the system integration is 100 times better.

'Macintoshes' are NOT price competitive. Some clones are beginning
to be. However, to achieve this, they typically have to strip the
machine to the bones in the process. Add the merest minor options
and even the clones loose any edge.

Bear in mind that an 'option' on a Mac Clone might merely be a
case that can accept another removable media device.

>
>Just try having a layman install RAM, add an Ethernet adaptor and
>internal CD-ROM to a PC clone. See what happens. I have, and it ain't
>pretty.

The Ethernet may be problematic. The typical PC has many options
in this regard. Not all of them have the same level of complexity.
Configurability is a triple edged sword.

RAM is just a matter of plugging it in. This is no different be it
Atari ST, Mac, or PC. If they would have problems with this task
on a PC, they would fare no better with any other machine (mac incl).

The only hitch on a PC internal device is the possibility of plugging
it in backwards. The rest is a matter of plugging it in and running
the configuration software. If the device is already supported by
the current revision of the OS, this isn't even necessary.

Plugging in an IDE socket is much like plugging in a SCSI one.
Jumpering an IDE drive to master is much like terminating a SCSI dev.
Plugging in the power is much the same.
Mounting it in the case is much the same.

Without more specific details, your anecdotes aren't even that.

Some people have a knack for making their lives difficult no matter
what they're using. Others merely don't let the machine intimidate
them and just follow the instructions.

I concede that preemptive multitasking is very important and that the
MacOS should have had it for years. It was just wondering what everyone
thinks is so wonderful about sockets. I actually prefer because it
offers very graceful disconnects.

That is an interesting claim. According to both BYTEmarks and SPECmarks,
the 603e is faster than an equivalently clocked Pentium. The 604e chip
similarly outperforms the PentiumPro chips.

Toad's prices for used ST equipment are way too high, IMO. Last week, an
Atari dealer offered me a NEW FALCON for $300 (albeit 1MB, no HD).
Compare this with the $299 "special" Toad is offering on USED STe's.
Also, a few days ago on this very group someone was selling a VERY nice TT
for $300. I think people in this group ought to write to Toad and tell
them that we are not willing to pay these prices! I know that Toad has
long supported the Atari platform, but that is not an excuse to excercise
price gouging. If you agree, write to Toad "Toaday" and let them know
their prices are way off. I think the Atari community will be better off
with realistic prices set for equipment.

>Intel Alder PentiumPro 200 256+8/8 8.09 5.99 Jan96 www.intel

> THESE numbers would suggest otherwise.

They do suggest otherwise but I got this from www.ibm.com:

Performance (estimated) 6.7 SPECint95, 6.3 SPECfp95 @ 166/66, 1M L2

It is interesting that this indicates almost 25% better floating point
performance with 83% of the clock speed. I couldn't find numbers for
a 166MHz 603e so:

Performance (est) 5.6 SPECint95, 4.1 SPECfp95 @ 200/66, 1M L2 SDRAM

and, reducing everything by 87% (which is actually an exaggeration since
microprocessor performance does not increase linearly with clock speed):

4.6 SPECint95 3.6 SPECfp95

Do you know if the PPC chips are required to operate in an accordance
with IEEE-754 during SPEC testing? That would cost them a few fractions of
a point and some precision.

I'd give it least 5 years.
Look at the large number of dead operating systems that still have
groups:

Amiga (company bankrupt)
Atari (company bankrupt)
desqview (abandoned by quarterdeck)
coherent (company bankrupt)
Plan 9 (abandoned by AT&T for Lucent)

The only newsgroup that looks positively ill is the coherent
newsgroup. However, Mark Williams (the original coh company) went
bankrupt _many_ years ago.

It is a tremendous Mitzvah to always be happy!

I used Macs some years ago.
I looked at them again recently (I use Linux, Win NT and Win 95)
A couple of my secretaries use Macs.

I am amazed that the Mac OS still doesnt have preemptive multitasking.
I am amazed that the Mac OS still doesnt have robust security.
I am amazed that the Mac OS still doesnt have robust process memory
space isolation.
I am amazed that the Mac OS still doesnt have decent background high
speed comms.

These things have been taken for granted in most modern oses for years
!

It is a tremendous Mitzvah to always be happy!

You bet that comp.os.os2.advocacy will be around! I understand that there are still several hundred members of the Flat Earth Society as well.

At least this escapade has taught me, for one, never to trust IBM again. Customer abandonment once is sufficient, thank you.

I am amazed that Windows (NT, 95, CE) doesn't have scriptable applications
I am amazed that Windows (NT, 95, CE) can't boot from a removable SCSI disk
I am amazed that Windows (NT, 95, CE) can't use 4 monitors at once
I am amazed that Windows (NT, 95, CE) can't be booted out of RAM
I am amazed that Windows (NT, 95, CE) can't be used by my mom
I am amazed that Windows (NT, 95, CE) still have lame alias architectures
I am amazed that Windows (NT, 95, CE) are still limited to C: and D: drives

You know man, what you just wrote is common knowledge in the Macintosh
world. Still why do people prefer the MacOS? Because it works, and damn
good as well, I see Linux systems, NT systems and although I have to admit
NT 4.0 is not far off anymore, I am stil frustrated all over the place
when I try to do the same things on a PPro machine with NT that I pull off
with my humble little 601 PowerMac.

What are we measuring here? The performance of the chip or the performance of a workstation that uses that chip? You were the one who suggested that the processor should be tested without including memory systems, etc.

Let's deal with the security issue. Who won the contest to see if any
hacker could break in to a Mac server and bring it down? Since you say
Mac's have no security of course.

>I am amazed that Windows (NT, 95, CE) doesn't have scriptable applications

Wrong.

>I am amazed that Windows (NT, 95, CE) can't boot from a removable SCSI disk

Wrong.

>I am amazed that Windows (NT, 95, CE) can't use 4 monitors at once

Wrong.

>I am amazed that Windows (NT, 95, CE) can't be booted out of RAM

What does this mean?

>I am amazed that Windows (NT, 95, CE) can't be used by my mom

Can't comment since I have no idea of what your mom is capable of, on the other hand, I would give her the benefit of the doubt, you however do not feel the same.

>I am amazed that Windows (NT, 95, CE) still have lame alias architectures

Alias?

>I am amazed that Windows (NT, 95, CE) are still limited to C: and D: drives

Wrong again.

Amazing, with all the real shortcomings with Windows NT, you've managed to miss every single one of them.

No, as of yet IBM has not officially dropped support for OS/2. There is hotly-contested speculation that IBM is attempting to let OS/2 die a slow death rather than execute it with a single blow.

Note that *everything* which I will say here is highly controversial. The actual amount of uncontested facts available is damned small; what there are is rumors and rumors of rumors. So virtually everything I'm about to repeat could be either true or false. I am not, at least in this article, trying to make a statement; rather I'm making a quick attempt to summarize the best cases both for and against the contention that IBM is letting OS/2 wither. (And *every* one of these statements can be spun multiple ways, too.)

The case FOR IBM letting OS/2 wither:
1. The development budget for OS/2 has been dropping for some time, and there seems to be reason to believe that it will continue to drop.
2. Presence of OS/2 software in store-front retail outlets has gone from small to nonexistent in the last year, and IBM has not made any attempt to do anything about it.
3. IBM has announced that the target for OS/2 is business. High IBM officials have made disparaging comments about the home market as a target for OS/2. They occasionally toss in comments about "connected consumers" as a target, but that may simply be lip-service.
4. IBM seems to not be making much of an effort to cultivate support among 3rd party developers, either of hardware or software.
5. In the first half of 1996, sales of OS/2 were termed "disappointing" by IBM. Unofficially, they apparently sold about 1 million copies in the first 5 months of 1996.
6. IBM tends to announce sales figures when they're good; IBM has announced no sales figures for Merlin (Warp 4). In this case, "no news

is bad news" and reading between those non-existant lines it is likely that sales of Merlin have also not been good.
7. The supply of native applications for OS/2 continues to be disappointing.
8. Support for OS/2 elsewhere within IBM is something between laughable and non-existent. Especially IBM PCCo, which is probably the one division that PSP would most like support from, has basically abandoned OS/2 and spends all its time pushing Win 95 and Win NT.
9. Advertising by IBM for OS/2 has been sparse and unimpressive.
10. The last major monthly OS/2 magazine in the US just stopped publishing, primarily due to lack of advertising.

The case AGAINST IBM letting OS/2 wither:
1. IBM has formally stated several times recently that it is their policy to support and enhance OS/2.
2. IBM made a special deal with Netscape to port Navigator to OS/2, and IBM is giving it away for free. Though the details of the deal have not been made public, it is assumed that IBM paid Netscape a pile of money for this. Clearly this is a major investment.
3. About a year ago IBM spent an enormous amount of money moving people from Florida to Texas so as to consolidate the development for OS/2 at a single site. That would seem to be unlikely if they wanted to abandon the very product those people were working on.
4. IBM's Lotus division recently announced that they had contracted with an outside developer to port some of their major packages to OS/2.
5. While the supply of native OS/2 apps is nothing like as big as the supply of Win16 apps, it is still comparable to the supply of WIN32 apps, and OS/2 can run most Win16 apps anyway. Just how many spreadsheets do you need? (As they say, "More than a mouthful is a waste.")
6. The features of Merlin are the best of any version of OS/2 to date. The user interface has been upgraded, and voice-controlled navigation and dictation have been included at no extra cost. Even better, it is highly integrated with the desktop and permits easy control of the whole interface.
7. The OS/2 user community is highly connected, and electronic commerce for OS/2 software is alive and healthy. Indelible Blue can sell you anything you need, easily and rapidly, so who needs store-front presence anyway?
8. Equally, while the paper magazine may have gone under, there are several quite good e-zines about OS/2 and they are doing fine. [Although one of them let some asshole Win 95 advocate write a column for a while, but fortunately he gave up and quit.]
9. People have been saying "OS/2 is doomed" for years, yet here it is, going strong.

So there you have it. I've probably missed some points, but these are most of the important arguments which have been tossed around by people on both sides.

I think I can make the following statements without fear of contradiction from anyone:

1. IBM is, as they always have, doing a less than sterling job of marketing OS/2.
2. IBM is not investing as much money in OS/2 as advocates wish they would.
3. 3rd party support for OS/2 is not as good as OS/2 advocates wish it was.
4. The signals from IBM as a whole have been ambiguous.

Absolutely not. IBM has stated they will continue to support OS/2. This thread is more speculation than anything else, so make of it what you will. I personaly believe IBM is working to bring together a more solid strategy around OS/2 -- they recently stated they were working on tying OS/2 in with their Network Computer initiative. Others may scoff, but they have no real proof (other than their own personal reading of the leaves). I may be reading in as well, but *no one* has final word on what is happening right now -- it's all based on action or nonactions by IBM, but *no* official announcements have been made.

<snip>

Interesting post, and refreshingly unbiased. I like to think that IBM is working to come up with a fresh strategy for OS/2, based around Java and the NC initiative. It could be wishful thinking, but no one can tell me for certain that it is or is not true.

It *is* frustrating that IBM can't come up with a more coordinated effort with OS/2 -- what's so difficult about making the PC Co and PSP work together on creating a good preload package for the Aptivas? Why can't IBM get a good OS/2 suite out the door? Why can't they bundle new software and package them more attractively? Netscape's and Stardock's efforts are the best initiatives I've seen in this direction; why can't IBM take a cue from these vendors and market their own stuff this way? These are simple things that don't cost huge sums of money, and could make all the difference in dispelling the "OS/2 is dead" stories.

Unfortunately, the longer IBM waits to address these issues, the more creedence is given to the rumors, and the harder it will be to revive OS/2 later on.

Very nicely done post! I don't know why people are so concerned about the future of OS/2, from the standpoint of IBM's support. Heck, we have each other, and the operating system itself, won't go anywhere, right. I use, and will continue to use OS/2 Warp now and for the next umpteen years. I'm certain it will run most of the programs I will ever want to use; so why should I worry if another version of OS/2 isn't made.

Use it, be happy, and support oneanother. Let's face it, if we don't help each other, then than is when, and only when, OS/2 is really doomed.

-Joseph

Actually, with MS's Dfs I can move the app anywhere and the mount point doesn't have to change as far as the client side is concerned. In otherwords, \\tango\tmp can point to anywhere and can be changed on the Dfs server without having to have the client remap it.

>And what's that "G:" doing up there?

If you mean "H:", it's the default location where the shell starts up from (since that's where it's located). I can have it point to \\tango\tmp if I wanted to (by setting the startup directory in it's shortcut). I just didn't bother since the poster just wanted me to show him that NT is not limited to drive letters.

Umm, guess again.
Using OLE automation you most certain can do what you describe.
Infact, using OLE automation, I've been doing what you describe (and
helluva lot more) for the last four to five months.

>> <> SCSI disk>>

What are you talking about?
NT can be made to boot from a removable device. And why would booting
NT from a removable media affect the NTVDM?

>> <>
>>
>> Wrong for NT & 95, there are cards allowing you to use 4 simultaneous
>> and different monitors.
>No, No, We are talking about the OS and it's build in capabilites!

No, No, read the statement:

"I am amazed that Windows (NT, 95, CE) can't use 4 monitors at once"

I don't see "built in" capabilities anywhere in that statement. The
fact is NT can support multiple monitors. Now you just want to change
the criteria since the first statement was proven to be false.

So...you have "long drive letters". If you have an app on tango and move it to mango, things break if the app has stored it's path somewhere. You can't just remount mango to the mount point that tango was on and have everything still work, nor can you make a symbolic link to the new spot, right?

And what's that "G:" doing up there?

Get Microsoft's update. I want to call it DFS, but I'm sure when
Sang gets back he can tell you more. It abstracts location of files
on the server from the clients. Quite nice.

I think that we will need to find out exactly how all the SPECmarks are
generated before we can compare them in any meaningful way. I especially
wonder why the numbers that you gave were so different from IBM's
estimated performance. I really suspect that the workstation test
was not using FMADD instructions which would account for the
very odd floating point results.

> You haven't been looking very hard or are just lying? Word and
Excel
> are so scriptable they have their own virii.

They are CLOSED scriptable... you can script inside of them - but not across them and other apps. The Macs SYSTEM AND APPS use the same scripting mechanism.

Example - on the Mac I can open a spreadsheet, create a file, save the file, have the script select the file from the finder, move the file across the network, then open a different App, import the file - save the new file (in a different format), then delete the old file. That is scriptability and the type of thing you cant handle on Windoze. EACH APP must have its own scripting capabilities - different from every other app.

> >I am amazed that Windows (NT, 95, CE) can't boot from a removable
SCSI
> disk
>
> This depends entirely dependent on the BIOS, not the OS.

But the point is that on the Macs it works... period... on the PC's it may work under certain circumstances... or it may not.

> >I am amazed that Windows (NT, 95, CE) can't use 4 monitors at once
>
> This is also WRONG. Troll around the STB homepage. The PC
solution
> is different.

The point is that on a Mac you can take 3 different video cards - off the shelf, and use the internal video, and drive different monitors with different resolutions and display characteristics and have one large workspace... and have concepts like main monitor and UseBestResolution/UseBestColorDepth/etc.... you can not do under windows - and the "solutions" that allow more than one monitor are proprietary hacks that may or may not work well with other things.

> >I am amazed that Windows (NT, 95, CE) can't be booted out of RAM
>

> I think that the Atari ST/TT/Falcon would be the only ones
> capable of this feat. MacOS was never small enough to manage
this.

Huh? I've booted off RAM disk quite a bit... lately its getting harder - but it was not uncommon (though not common either). In fact the Mac Classics had a ROM disk to boot off of. Boot one while holding option-command-x-o... no hard-drive or floppy need be attatched. (They were going to do some diskless serving stuff, but never finished it).

> >I am amazed that Windows (NT, 95, CE) can't be used by my mom

> Perhaps my mom should teach your mom.

Perhaps his mom should teach your mom that you should be a computer expert to use a computer.... sorta like you shouldn't have to be a auto-mechanic to drive a car. But if you own a Jag it helps.

Umm, no.
Dfs (that's captial D, lower case f, lower case s. DFS is trademarked
by Transarc) is somewhat orthogonal to the issue.

I agree, Dfs is nice. But that is more along the lines of keeping
sysadmins (and users) sane regarding multiple mount points (ie.,
ridiculous number of drive letters for network shares).

The use or non-use of drive letters at the local machine is purely
shell dependent. In the case above, I used a shell called 4NT.

Too big. 8-)

Even NT's ping implementation (which has the bug of letting you pass a
bogus sized ICMP packet) won't accept that large a packet.

You're thinking of 'ping -l 65510 blah.blah.blah...'

Actually, at my alma mater, there was (until this fall) an entire roomful
of diskless Mac LCs that ran the OS off a RAM disk. System 7.1, though.

This is more mac FUD. What advantage a mac system may have over
a PC is most probably due to memory interleaving. When compared
on a more even footing in this regard, Pentia actually perform
BETTER than PPC's.

Considering that only certain mac clones seem to have this, even
this benefit doesn't seem universal. Note how only certain PowerC
models allow one to optimize the simm layout for maximum interleaving
benefit.

I've yet to see a benchmark in which a PC was bested where issues
like these were addressed. When they are, Pentia end up being faster.

>require a Pentium system running at a 20 to 40% faster clock speed to
>equal it.
>
> The best PC for $2K I could find (quality PC, that is, not Packard
>Bell) was a Sony AVIO at COmputer City. I was far from impressed.
>Incidentally, it was a Pentium 166.

Considering that this system likely has feature improvements over any
of the macs in it's price class or features not present at all in
equivalent macs, it's not a completely honest comparison. Typically,
the only machines that match mac features are the Packard Hells.

The video specs are especially amusing. Given the lack of detail they
are presented in, Mac video specs seem to compete only with the
generica. 1Meg 64bit video without 3D acceleration would be considered
very substandard on any brand of PC that a MacVocate would call
'quality'. We're talking bottom of the barrel here...

Then there is the low end SCSI2. Excepting bootrom, this is also the
very bottom of the barrel wrt PCs. Furthermore, SCSI2 underperforms
IDE Mode 4 which is quite commonplace on even cheap PCs, not to mention
the ones a MacVocate would call quality.

Excepting disputed cpu benchmarks, most macs can only compare to the
Packard Hell's. To do otherwise typically would require upgrades that
quickly make a mac of any kind loose price advantage.

[deletia]
>604's outperform Pentiums at equivalent clock speeds on all levels.

No they don't. To say so is blantant intentional misrepresentation.

Furthermore, it wasn't relevant to the comparison.

[deletia]

>Macintosh.

IC. So, you are saying that the greater number and variety of
expansion slots, extra device capacity on the device chain,
extra device capacity on the floppy chain & a case that actually
has external drive bays is less expandable than a system with
less slots, less types of slots, less availability of alternate
motherboards, less availability of CPU upgrades, less availability
of upgrades of any kind and no external expansion capacity in the
case.

Hells are harder to upgrade relative to other clones. This in no
way can be honestly construed as being harder to upgrade relative
to macs.

>
>Your claim about Mac clone "stripping" is actually an apt description of
>Packard Bell and MOST bargain-basement PC clones. Ever try to replace

Installing a SCSI card would be no less difficult with any PC.
Neither would a CDROM. Other things would depend upon the level
of integration. Even those would likely not be a problem as you
can disable the onboard video, sound and such.

It is a Packard Hell, not a MacPlus.

>require HUGE expenditures in additional hardware because of their
>"bargain basement" rankings. Their quality is unacceptable.
>
>An APS low-end Mac clone includes 16 megs of RAM, 16 bit stereo sound,
>keyboard, mouse, a 1.2 gig hard drive, a 160 MHz 603e, IDE and SCSI,
>ability to use a VGA monitor and PS/2 mouse ports. Hardly a "strippo"
>system.

This quite aptly describes a Packard Hell, actually. Everything
else tends to have more and better of everything. PS/2 mice tend
come with DB9 adapters to that is no real advantage. Everything
else, except the ultralowend SCSI, can be found on the Packard
Hell.

Unless you like octopi, the slow SCSI2 has little real advantage
over what is delivered even on a Packard Hell.

>
>Another thing you get with Mac? Real multimedia that's easy to use. PC
>multimedia is many years behind, unrefined, and a hodge-podge of
>BIOS-conflicting, IRQ-confusing, expensive, poorly-supported hardware

MacVocates: master of lies.

For 3 years, at least, multimedia has been plug-n-play
at the hardware level. The smaller vendors have tended
to mimic the dominant one to such a degree as to create
a defacto standard in that regard.

The assertion that anything is expensive on PC's when compared
to Macs is beyond absurd. PC's and ultracheap hardware can be
problematic. This is something that Macs don't have however.

>and software. And since multimedia is what many people aim for (even if
>merely for games), people again get what they pay for.

$200 will get them as much plug-n-play multimedia as a CheapMac
can deliver. It will be from the leading vendor (Creative Labs),
will be well supported on any x86 OS (Linux included) and will
be quite well supported.

Who in macdom have their board digrams online?

If you knew what you were talking about, you might be able
to identify the real PC problems. As it is, you seem only
capable of sniping the PC at it's least vulnerable points.

>
>The multimedia capabilities of that $1,499 Performa 6360 or $1,399 APS
>blow the $1,299 Packard Bell out of the water.

So? What are they going to blow the Hell out of the water with:
sad dellusions? The Hell has the same sound capabilities, the
same cdrom capabilities and similar cpu power.

Add that $200 multimedia kit to a 4 year old 486/33 ISA system
and the APS or Performas wont even be able to 'blow' it
'out of the water'.

It would be nice if some concrete examples were given.
As of yet, you're just bluster.

BTW, the $200 Multimedia kit mentioned is the Creative Labs
Value CD 8x. It contains a pnp version of the SoundBlaster
16 IDE and an IDE 8x cdrom drive.

This is all there is to 'multimedia'.

Well, that's why you check the packages for PLUG & PLAY or
a Windows95/NT label. Or, just look through the control panel.

>

>megs), and couldn't get it to work. Why? The BIOS had to be put

Sounds like an ancient BIOS.

>through some sort of arcane process before it would recognize the new

I wasn't aware that mac users thought that menu driven systems
were arcane.

>RAM. That network had so many problems that they ended up hiring a
>seperate hardware consultant, and, I understand, purchased a new
>server. Not a glowing endorsement of PC technology.

I have seen relatively recent Gateways being upgraded in that
fashion. A BIOS reset was oddly absent. This anecdote seems
quite a bit out of date. The last machine I saw with such an

antiquated BIOS was a Wyse 386.

>
>In a Mac setting, the systems could have been installed by an entry
>clerk, with minimum help from me. Even if they had gone for the most

Much like the relative ease in which my wife upgraded her ram.
Her machine is a skanky, 4year old, bargainbasement, junkware,
Cyrix PC and yet even it didn't have such an awful BIOS. Perhaps
MacVocates shouldn't pick on junkware quite so much...

>expensive, least-cost-effective Mac systems, they would have saved tens
>of thousands of dollars in downtime, new hardware, and consultancy fees.

I think you're full of it. Still you have not come up with any
level of detail. Furthermore, you had to troll into the mail
order domain to get it. I am also not sure about the decade in
which that hardware was manufactured either.

PC's are the proverbial tortoise to Mac's proverbial hare. The
PC's started out slow but have been slowly evolving and improving
in an enviroment of rigourous competition. While, on the other hand,
Apple has primarily rested upon it's laurels secure in the knowledge
that their userbase is so devoted to them that they will never have
go to the touble of maintaining that devotion by at least keeping up
with MicroSloth.

In the end, Apple ends up groping for BeOS and NexSTEP as PC's slowly
improve.

Even 3 years is an eternity in this enviroment. Despite this, the ease
of adding multimedia to a PC has remained fairly constant. If you do
manage to run into trouble such trouble definitely will not be
accompanied by hardware that can be sanely said to be 'expensive'.
Even the best, trusted brands will outperform Mac one's in price.
However, other devices have become more standardized and a plug-n-play
spec for ISA and PCI have come about.

True there will be some problems. However, if you restrict yourself to
sorts of producst that pompous MacVocates would be willing to buy, you
should not have any troubles. Despite this restriction, you will still
have quite a bit of choice. You'll even get to browse for your selections
physically, if you really want to.

>

MacVocates: they shower devotion opon a platform for ease of
use and then make their lives as complicated as they possibly
can on any other [platform].

Just run MSD, you rube.
The DOS installation utility will also likely tell you
what the necessary IRQ's and baseaddresses are.
Nevermind... there's always... tHe MaNuAl...

>various mixtures of IRQ numbers until you find the problem. Spend about
>four hours doing so. Assign new numbers that Windows NT 4 will find
>acceptable. Tear out hair. Reboot. Get new driver from hardware maker
>because it won't allow reassignment. Tair out hair. I've been through
>all this before, thanks. It ain't Plug and play, no matter what Bill
>Gates dreams it should be.

I don't suppose it would be expecting too much of you to have
checked the supported device list before going off half cocked.
Given your pessimism regarding PC's, such behaivor should be a
very minimal standard. This is especially so if you presume to
be a professional.

NT is quite a bit less tolerant than either MacOS or any other
variant of Windows.

With any other CDROM of any kind and any other MicroSloth OS,
you should have just been able to run the installation software
that came with the drive. Win95 even supports DOS drivers for
devices that aren't well supported on it yet.

So? What was that device again? Brand? Model? Interface?
Hell, you couldn't even be bothered to tell us what interface
it were using...

An IDE cdrom drive is plug-n-play EVEN IN LINUX.

At this point in time, as opposed to some distant year, THAT
is the vastly predominant CDROM type for PC's. Even 2 years
ago they were becoming somewhat scarce.

If you buy a PC TODAY, and in not some distant year, the commonly
available CDROM drives (IDE) will be as easy to install on that PC
as a SCSI one would be on a mac.

The discussion was never about attaching ancient CDROM's to ancient
PC's. If you and the rest of MacDom would like to live in the past,
that is your perogative. The rest of the world is moving past you.

>
>

>product? I would - as far behind it as possible.

Spoken like a true ignoramus. You don't have enough
PC knowledge to demand money for your services.

PCdom is quite like a mine-field. There is quite a bit
of legacy hardware floating around. If you go searching
for it, and this is what you have to do to find it, you
will get fragged. It would seem that your biases tend to
lead you and your victims (customers) straight at the mines.

>wonder why the numbers that you gave were so different from IBM's

They weren't different from IBM's: THEY WERE IBMs.
I gave sufficient information from my last cite that
someone could easily verify it. My other cites were
also similarly verifiable and all were of IBM hardware.

There is little mystery in why more concrete, verifiable
examples would contradict a relatively vacuous, poorly
cited 'estimate'.

Furthermore, an 'estimate' from IBM seems highly dubious.
They don't need 'estimates'. They manufacture the chips,
the machines & the OSes. They are all in production and
can be tested directly. Estimates are simply not needed.
I doubt that IBM would find them in any way useful.

This would be a shell level script language actually.
This was NOT the challenge.

[deletia]
>> Wrong for NT & 95, there are cards allowing you to use 4 simultaneous
>> and different monitors.
>No, No, We are talking about the OS and it's build in capabilites!

I was not aware that a Mac was capable of using multiple monitors
in the absence of multiple video hardware. If this is actually the
case then Apple really has innovated... '-p

Your challenge was '4 monitors'. You did not specify HOW. The
challenge was met, despite your protestations.

Now, however, if you would have said that NT cannot manage to use
4 svga video cards at once, you would have a challenge that NT cannot
meet.

However, that was NOT the challenge.

Need 4 monitors? Replace the video card and load the appropriate
driver. This is no more than what a Mac would require. Although,
with this solution, you have 3 more slots left. If the machine
didn't have 4 slots to begin with, that could be mighty useful...

You said 4 MONITORS, not 4 VIDEO BOARDS.

Since this was hashed about a few months ago, his meaning was obvious
to me. Simply put, the Mac OS can use multiple monitors without the
need for specialized cards to do so. He's correct in his original
assertion, your changing it to suit your needs.

Taken to literally, as things often are here. I think he was refering
to drive letters in general, not specifically "C" and "D". Drive
letters are one of the few things I do not like about NT.

Josh

Since that was a few months ago, the context isn't the same. That
should be obvious to you.

>Simply put, the Mac OS can use multiple monitors without the
>need for specialized cards to do so. He's correct in his original
>assertion, your changing it to suit your needs.

Since when?
The original assertion was that NT can't support multiple monitors.
There was absolutely nothing about whether that support was "built in"
or not.

The latter only came up after the *original* assertion was proven
false.

Look above carefully. Drive letter are there simply for compatiblity
reasons. You do not have to use them nor are they even required.
Infact, you can use disk admin to remove every single drive letter
from all your partitions--using just their lables/shares to access
them.

Gee, that's really clever - the Macintosh OS can use multiple monitors on
hardware that does not support multiple monitors!

If you've done six impossible things today...

>the processor should be tested without including memory systems, etc.

It is a practical impossibility to completely isolate a microprocessor
from it's attached hardware. It requires that attached hardware to do
any work.

I suggested that statistical skewing due to factors outside of the
microprocessor be minimized. Other variable factors within the
respective machines should me made as equal as possible. Ideally,
one machine capable of using either processor as the main cpu
would be most appropriate. Short of that, the machines should at
least have equivalent features. Everything outside of the CPU should
be as close to identical between the machines as possible.

Otherwise, it's nothing resembling a CPU benchmark anymore.

The results may be able to say something but: it won't be
cpu X is faster than cpu Y.

Of course allowances can be made for architecture features that are
simply not present on one cpu or the other.

Either way, 'estimates' are still worthless.

Does NT support multiple monitors? Or does a special video card and
driver set? Can I take my NT workstation that I'm typing this on, and
add any graphics card I want and have multiple monitors? If NT
supports multiple monitors, then I shouldn't have any problems doing
it should I? If you answer that I need to buy a special video card,
then I don't think NT supports this...the specialized video card does.

Can you explain this further? I'd really like to remove all drive
letters from my NT installation. I understand about the share
names,that part is easy. I'm lost as to how I would access the drives
from the console without any drive letters (IE, a non-networked NT

system). I'd appreciate the help.

Where did I claim this?

The Mac OS can support multiple monitors on any mac where multiple
video is installed. Some macs may not allow additional video to be
installed, but if they did, the Mac OS would support it.

Actually, I believe that the value of the estimate increases due to the existance of the examples that you cited. IBM is obviously aware of the SPECmarks awarded to it's workstations so the estimate is obviosly not baseless. IBM could be compensating for the fact that xlc does not generate FMADD instructions or some aspect of their hardware that reduces the performance of the microprocessor. Tomorrow, I think that I'll ask IBM where they got their numbers.

Actually I just clarified (with differences in the scripting)...
someone else made the point.

If you don't understand the difference between one common open
event/scripting model, and the way windoze does it, then I suggest you
read up more... it would take too much time to enlighten you. But VBA
and MS's scripting models is not even CLOSE to what
AppleEvents/AppleScript is.

It does to! If you can't create a good HAL (Hardware Abstraction
Layer) and you can't integrate the OS with the Hardware (the responsibi=
lity of the OS I might add).... then you've got a shitty System.

Also note, I didn't start that thread - I just reponded to your
response.

The PC-OS's dont do what the MacOS does BECAUSE the MacOS is more
integrated with the hardware. That is what OS's are supposed to do. I
know WHY MS has problems doing so - but that doesn't change that the
OS sucks more because it can't do what it should.

> with any variant of Win.

I didn't say it... I was clarifying what that person meant (or should
have said).

The point is the Mac way is still better. The Mac WILL allow multiple
monitors quite easily and cheaply. I can buy $100 video card and add a
second monitor (and on some Mac dual monitor support is built in)....
I have 3 monitors at work, and adding a second at home again (I used
to have dual). This is not achievable in the same way, nearly as well,
and at the same costs, for PC's. And once done on the PC's it doesn't
work right (the way it should) anyways.

>
> Despite what MacVocates may claim, one set of graphical menus
> is not significantly different than another to a user such as
'mom'.

Lets try this.... you can create good turn-key solutions with PC's. If a PC comes pre-set-up, and pre-configured to run one or two apps, etc... then the PC's are not bad solutions.

But if you want to actually use a computer AS a computer... to add an app, to change a configuration (without it blowing up in your face), add a card, update the system, add a printer, etc... the Mac is better. Users can understand things easier on a Mac, and more things have more predictable behaviors. Its a better computer - but as for the better solution, that depends on what you are doing. (In large companies when you have IS depts. that are paid to maintain your machines, etc. the PC is not nearly as bad as in the home).

Obligatory car analogy -

PC's are OK if used as a bus. (Someone else selects the routes and drives for you). They are great if you are a bus driver or mechanic.

But the Mac is more like a car... you can add your OWN things to it.... you can go where you want to go, when you want to get there.... and its simpler and easier to understand than the BUS's mechanicals, or even the complexity of routes, schedules, etc...

>>or not.

Actually the assertion was 'multiple monitors' only. There were no
other restrictions given. NT can accomplish that which was stated.

Furthermore, NT can also support multiple video cards. A MacVocate
would have to put extra conditions on the statement to make that
impossible for NT as well. (vga+herc)

The mac examples are not nearly restrictive enough to handle the
multitudes of PC variations.

>
>
>Does NT support multiple monitors? Or does a special video card and

'Special video card' & 'driver set' describes any video card for
either platform. (excepting PCs using vga,ega,cga or herc)

>add any graphics card I want and have multiple monitors? If NT

If that was what was originally intended, THAT is what should
have been said. Revision after refutation looks so sleazy.

>supports multiple monitors, then I shouldn't have any problems doing
>it should I? If you answer that I need to buy a special video card,
>then I don't think NT supports this...the specialized video card does.

Typical MacVocate hypocrisy:
We need to get 3 more cards and have their drivers in order

to use our solution.

But if you just buy a single card and have it's driver, that
wont count as a valid solution.

The multiple frame buffer card requires a video driver, not unlike any
other video card. In the absence of surplus hardware, the distinction
you are making is meaningless.

>lity of the OS I might add).... then you've got a shitty System.

At least some of the microsoft OSes have a HAL. That
puts them far beyond MacOS which is tied to one particular
set of hardware still executing binaries from the last
cpu family in emulation. Any RISC versions of NT are native.
That cannot be said for the 'RISC version' of MacOS.

So.. essentially... this is the MacVocate position:

Win/NT does not support features not supported by the
underlying hardware, therefore it is shitty.

MicroSloth does not have a draconian stranglehold on the BIOS
vendors. M$ has to implement over what it is given. This is
quite distinct from Apple's 'big brother' position over Mac
hardware.

That Apple could best MicroSloth under such conditions does not
do any credit whatsoever to Apple. In this case, Apple has the
same sort of 'unfair advantage' that microsoft is often accused
of.

All else being equal, MacOS has no advantage in this area. MacOS
can only claim advantage in this area when things are not equal.

If MacOS needs such cheap propping up, then it would appear there
is not much being propped up.

A Win16 box can do this as well. Although it will be a $10 video card.

>I have 3 monitors at work, and adding a second at home again (I used
>to have dual). This is not achievable in the same way, nearly as well,

That is quite a different restriction.

>and at the same costs, for PC's. And once done on the PC's it doesn't
>work right (the way it should) anyways.

This is pure fabrication based entirely upon bigotry.
You have no basis for this assertion. If MacOS is so
'superior', such tactics should not be necessary.

So? How is one graphical menu significantly different from another.
Also, I wasn't merely refering to win16, either. The same could be
said of 10 year old Amigas or Atari's or Commodore's or PC's with
GEM or even a 10 year old version of X.

>
>But if you want to actually use a computer AS a computer... to add an
>app, to change a configuration (without it blowing up in your face),

Just what do Mac users find so hard about hitting the return key
several times?

Also, just what configuration changes will blow up in your face?

>add a card, update the system, add a printer, etc... the Mac is

'update the system', what is this?

'Add a card' is rather vague as well. There are PC cards that are
older than any Mac (or even Lisa).

Adding a printer is quite trivial as well. If it isn't a relic,
the current revision of the OS will install it for you.

>better. Users can understand things easier on a Mac, and more things

You've yet to mention why or give some concrete examples.
Surely your 'mom' could provide us with a few. Although,
I suspect any examples will be rather dated...

>have more predictable behaviors. Its a better computer - but as for
>the better solution, that depends on what you are doing. (In large

Yes, but you've never said why (beyond csh++) in any concrete
or reproducible fashion.

: Power without the Price used to be more than just empty words.

I've looked at Toad's website. Yes, the prices are higher than you can get from a second-hand shop or a direct used sale. That's the nature of being a dealership--on used equipment sales, you can't compete with what somebody just dumping a machine will ask. Somebody just dumping a machine can't take your credit card and be a legal entity you can take recourse against if there's a major problem, either.

As for your statement about supply and demand, you can apply it to them just fine. Don't demand their machines and you're applying it. What's the problem there?

Nobody's asking you to be benevolent. If you think Toad's prices are too high there are other places to get the machines from. They're setting their margins, other people have their own. Personally, I think they're too high for me, so I'm counting on a sales post here to come through. But others may disagree.

I hope you don't mean this argument. You could say that about
anything! My ST can't raytrace 24 bit 200x200 pictures in a few
minutes but if I put a whacking great big processor in it then it could,
therefore your argument says that my St is capable of of raytracing 24
bit 200x200 pictures in just minutes. It isn't, I've never heared a
valid argument with a "but" in in it.

Yeah, but the Mac requires NO drivers. Put the cards in, hook up the monitors, start the Mac go to the Monitors control panel, tell the control panel where you want to put the other monitors in relation to the original (main) monitor by moving the icons around relative to the main one, set your resolutions and color bit depths, and voila! Its done dude! BTW, you can also change bit depth and resolution (on multi-sync monitors) ON THE FLY. NO REBOOTING!

Shockingly, this is a fairly recent development. For example, with
7.1 on a Centris 650, I had to grab NEC's DPI-On-The-Fly software to
do this. Amazing...

Generally drivers are required, when the board has features that are not
supported by Apples built in drivers. There are lots of drivers in the
Macintosh OS. I would print this using a printer driver. We call them
things like extensions, and control panels though.
Oh yeah, and they conflict a whole lot less often then wintel.

I think you may be missing something in the first post. He wants to
create the
script to control functions not only of an application, but also of the
OS itself.
As far as I know, OLE automation can only automate the behavior of OLE
objects which
must be exposed by an OLE Server. I don't think Windows itself is an OLE
Server -- yet anyhow(I could be
wrong here, please correct me if I am). One thing is certain though --
creating an
application which automates OLE objects isn't like making applescripts.
Certainly OLE can be
used to create very powerful data management solutions, but the learning
curve is much
steeper than the quasi-english used in applescript. VB for Apps is
pretty simple to use for OLE work,
but you still have to have some concept of methods, properties,
objects...

Can one use OLE Automation to shut down a Win95/NT PC?

Mark

> ------
> John De Hoog
> dehoog@super.zippo.com

Actually Mac extension conflicts are not all that common. I know
people who have had Macs for years and never had one. The problem
arises when someone uses a lot of shareware extensions and control
panels (which I will cal by their old name "inits" because its easier
to type) Apple has a strict programming protocol for inits, that if
followed, should never give trouble. Unfortunately, the temptation
to gain some advantage by circumventing those protocols is often
great, and then you end up with problems. Some third-party mfgs
succumb to this temptation as well. NOW software makes a set of
utilities that at one time were shareware. Most "Power" Mac users
wouldn't be without some of them (Now Startup Manager, Now Menus.
Now Wysiwyg, and Super Boomerang being the most popular) because
of their humbel beginings as shareware, this suite of extensions can
be troublesome. They used to cause problems constantly. The latest
versions (6.5) are nuch more stable than they used to be, but it is
still possible for one of their pref files to get corrupted, then
watch out. Since it is impossible for any of us to know what a person
who comes here for help is running, yes, we always suggest that he
start the search for his problem with all extensions turned off. That
does not mean, however, that an extension conflict is ALWAYS the
culprit as you suggest in your above comments. Various conflict

resolvers, are, on the Mac side, a lot like un-installers on the PC. Mot absolutely necessary, but nice to have around when you need them. BTW, those who never install ANY third part inits on their Macs, never have init conflicts. The Apple supplied system inits do not (as a general rule) conflict with one another because Apple requires that they are written to spec. Then the new ones are tested in house with all other Apple inits to make sure.

Whoa! Back-up here. I wasn't aware that Iomega made video cards! All
we are talking about here IS VIDEO DISPLAY. And I have a new ATI
PCI video card in my Power Computing PowerCenter, it came with no
software, no drivers. Plug it in, turn on the computer and it works
at any resolution and any screen size supported by 4 megs of VRAM.

Of course, some hardware additions need inits to work, otherwise
the computer has no way of knowing the stuff is there or what its
supposed to do. No one is trying to deny that. Its just that on the Mac,
monitor support ain't one of them!

>
> >I have NEVER seen or used any Nu-bus, PDS, or PCI

They do not exist, Sang, BECAUSE THEY ARE NOT REQUIRED! Some video boards, as I've pointed out before, may do special things (like acceleration which can be turned on or off, or the ability to zoom in and out of the screen by using some macro commands), these, of course require an extenion or control panel to enable these features, but leave the control panel OUT and the video board still works, still allows you to switch resolutions and bit depths on the fly. Once again, VIDEO drivers do not exist for Mac video boards, PCI, Nu-bus, or PDS, because they aren't needed!!!!! I don't see how I can get any clearer than that.

No, since PC:s doesn't have SMB networking in BIOS they need to load
that support from a local disk.

BTW: NT's loader doesn't care about C:, D: etc either, it uses drive
and partition numbers to address the correct partition on the correct
drive. (Check BOOT.INI on a bootable NT partition)

You can boot Win '95 from a Zip Drive, CD-ROM drive?

> >I am amazed that Windows (NT, 95, CE) still have lame alias
architectures
>
> Alias?

They are called shortcuts in Windows. If you make a shortcut in Windows and
then move or rename the file. Windows has a hard time finding it. The Mac
can track the original file no matter what you do to it. On a related
note, create a file in Word and then go out to the Explorer, assuming you
are allowed to, now move and rename the file and go back into Word and see
what happens. I did this on the Mac without even thinking. The
application knew the file had moved and had been renamed and was still able
to save the file in the new location and with the new name.

Because Mac users often have no fear of changing their system around (unlike PC people)... and Macs are still computers. They CAN get themselves in trouble... it just takes 100 times more work - or for them to start doing things that they can't do on a windoze machine to begin with.

> On the other hand, I've never even seen a driver "conflict" on a
> Wintel machine. Please elaborate.

Try any conflict with Autoexec.bat, Config.sys, BIOS not recognizing a device, or devices that aren't recognized or don't work, etc., etc...

>
> At least some of the microsoft OSes have a HAL.

Sure... and those OS's (WinNT) don't work with Plug&Play.... so it
abstracts the hardware a little - but you have to plug in custom
drivers to use it, and if you configure it wrong (which is easy to do)
your system dies. Cool design guys! Typical of MS.

> puts them far beyond MacOS which is tied to one particular
> set of hardware still executing binaries from the last
> cpu family in emulation.

BZZT! WRONG!

What do you expect from Windows trolls.

> Any RISC versions of NT are native.
> That cannot be said for the 'RISC version' of MacOS.

What does that have to do with what we were talking about? Changing
subjects like that is called a "dodge". Nice try though.

> So.. essentially... this is the MacVocate position:
>
> Win/NT does not support features not supported by the
> underlying hardware, therefore it is shitty.

No. That WinNT is only running on a minority of the systems (about
1/10th the Macs)... so its not mainstream. It doesn't self-configure
hardware, and has lots of issues with configuration, has lousy
documentation, is not that stellar a performer or that powerful
compared to VMS (which is was modeled after) or Unix (its
competitor)... etc., etc... all things that would go towards calling
something a "Shitty" OS. Yes it has a slightly better scheduler and
protection scheme than the MacOS - but an OS is a lot more than just a
sheduler.

Win95 which runs on more of the Wintel platforms has crappy plug&play
compared to the Mac... has weird compatibility issue with older apps.
Runs on DOS - but a little less than the past. Has shitty memory

management issues like those low-mem shared globals for GDI/MDI that you can fill up and crash the system, it sometimes is CMT and sometimes PMT... it is the bastard child of all MS OS's that came before it, and is typical MS hacked up garbage.

DOS and Win31 aren't even worth talking about... as even most MS worshipers will NOW admit they they always have been garbage and always will be. (They will do the same for Win95 and the current WinNT in a few years as well).

> MicroSloth does not have a draconian stranglehold on the BIOS
> vendors. M$ has to implement over what it is given. This is
> quite distinct from Apple's 'big brother' position over Mac
> hardware.

Not true... MS could have put in their own BIOS HAL layer from the first version of Windows. They didn't... and they got bit by it... thats THEIR fault - no one elses.

> >Also note, I didn't start that thread - I just reponded to your

> You don't even understand what you're talking about.

No. Its much simpler. If an OS can't abstract the hardware well - one of the most basic functions of an OS - it seems pretty idiotic to call it a good OS.... unles you are an MS troll... then its par for the course.

> >The point is the Mac way is still better. The Mac WILL allow

> >second monitor (and on some Mac dual monitor support is built
in)....
>
> A Win16 box can do this as well. Although it will be a $10

video card.

No... it will allow you to add a DOS command line ONLY on the second card. Big harry deal. Thats not using the extra desktop space - that allowing you to debug your crappy OS or Apps in a command line. <Yawn> I know this may be exciting to PC types... but Mac users expect their hardware to work right.

> >I have 3 monitors at work, and adding a second at home again (I used

> >work right (the way it should) anyways.
>
> This is pure fabrication based entirely upon bigotry.

Nope... pure fact based on using both. Duh! I'm an engineer, you simpleton, who programs both.... and I've got large company IS Dept. support. And I work with lots of other engineers on lots of platforms.

Everyone with a room temperature or above IQ, and who has seen a Mac w/MM's, realizes that the Macs multi-monitor support is better than the PC's... which is really non-existant. (I don't call a debuggin CLI window on a seperate monitor dual monitor support in the way people want to use it).

> You have no basis for this assertion. If MacOS is so
> 'superior', such tactics should not be necessary.

The basis is fact. You position is based on ignorance. Fighting for truth against ignorance of most DOS-trolls is what us Mac users are forced to do all the time. So fighting ignorance is necessary.

> >Lets try this.... you can create good turn-key solutions with PC's. If

> >etc... then the PC's are not bad solutions.
>
> So? How is one graphical menu significantly different from another.

One is at the top of the screen so you cant overshoot it... the other may be anywhere on the screen (see non-predictable location), can be overshot (which requires a sorta dampening effect to actually hit the target), can wrap around and be two lines of menus (making vertical hits even harder), the Mac cuts angles on hierarchical menus better, the Mac handles scrolling menu's better, Macs handle menu updates faster/smoother, etc., etc...

> >But if you want to actually use a computer AS a computer... to add an

> >app, to change a configuration (without it blowing up in your
face),
>
> Just what do Mac users find so hard about hitting the return key
> several times?

Nothing... when that works... but its like playing russian roulette.
You don't usually get killed - but when you do its most unpleasant.

Example - a co-worker plugged in both a Parallel Printer (HP) and
Drive (EZ drive). Drive would work until you printed something - the
pass-thru cable was a sick joke that is not really supported.
Brilliant.

I tried to use a different printer after my Win95 machine was up and
working... had to chase down the CD-ROM... (on the Mac I did the
change and it just worked - no re-installation)... when we did that
printer worked... but another printer wouldn't work anymore, my
network connection started getting tempermental, etc... typical PC
crap. Sometimes it works, sometimes it doesn't.

> Also, just what configuration changes will blow up in your face?

Mentioned above... but there are dozens or THOUSANDS of others. I've
had sooo many over the years with all those bullshit IRQ's and COM
port conflicts its not funny.

> Adding a printer is quite trivial as well. If it isn't a relic,
> the current revision of the OS will install it for you.

Nope... it will install it *sometimes* if you ask it, and it *may*
work (actually usually... but that not like the Mac which is 1,000
times closer to always).

> >better. Users can understand things easier on a Mac, and more
things
>
> You've yet to mention why or give some concrete examples.

Why? Your mind is closed.... it wouldn't do much good.

I could mention file paths... or having to MAP network drives to
letters and how fucking archaic that is.... I could mention shortcuts
that fail when you move something..... long file names that can't have
any special characters... and go on and on and on... but you will
blindly argue that its OK because MS is great and their shit doesn't
smell... etc., etc...

> >companies when you have IS depts. that are paid to maintain your
> >machines, etc. the PC is not nearly as bad as in the home).
> >
> [analogous tripe deleted]

And valuable points ignored I see...

>Server

I'm not sure what the distinction here is.
Any OLE Server can be manipulated. Every component, application,
control, whatever that is registered in the
HKEY_LOCAL_MACHINE\SOFTWARE\Classes is an OLE Server and can be
manipulated--including the shell (in this case Explorer).

If you mean using OLE to manipulate the kernel level objects directly,
you're right, I can't. I'm not so sure you can do the same with
AppleScript. You're right that only registered OLE servers can be
manipulated. However, I think you underestimate the depth and breadth
of OLE servers on a typical system. I would quite surprised if there
was somethng you could with AppleScript that I couldn't do with OLE
automation.

>...but the learning curve is much
>steeper than the quasi-english used in applescript. VB for Apps is
>pretty simple to use for OLE work, but you still have to have some
>concept of methods, properties, objects...

VBA is one of the languages you can use for OLE automation. REXX is
another. Perl, is I believe another (although, it has trouble with
OLE servers contained in .DLLs instead of .EXEs)

As to the learning curve, yes OLE automation is harder. However, I
would argue that OLE automation is also more functional.

>Can one use OLE Automation to shut down a Win95/NT PC?

Now wouldn't that be a nasty trick... :-)

Yes, it only requires an OLE server which has the functionality. You
can create a program that will issue a InitiateSystemShutdown() and
export that method. With MSVC, you can do this with about four lines
of code (the framework can be created using MSVC's AppWizard). Build
it, run it once, and you'll have it registered for any OLE automation
"client" to manipulate the program.

Infact, I wouldn't be surprised if you could manipulate the Explorer
shell itself to initiate the shutdown.

I wouldn't go so far as to call them "drivers", at least not in
the Intel sense. The Mac has a fairly strictly defined video
spec. Any monitor board which adheres to that spec simply
works. Now, of course it is true that if certain boards have
special features not supported by the Mac system (for
instance, for years Raster-Ops had a feature which allowed
you to zoom in on the screen with some keystrokes) then
they needed to include an extension or control panel to
enable those features. Keep in mind that the board would
work just fine without the extension, it just wouldn't
be able to access the special features. Wintel machines,
OTOH, need a driver for each board at each resolution and
at each color bit depth. In other words, compared with the
Mac, its a mess.

Then they are idiots. I have NEVER seen or used any Nu-bus, PDS, or PCI
video cards on the Mac which require any software (other than the what
is inherent in the OS) to run them. They are plug-and-play in the purest
sense of the word.

Which is why Conflict Catcher is among the Mac's hottest selling
software? Not to mention the extension manager in Now Utilities, or
the extension manager built into new versions of the MacOS. Or how
many times Mac users have advised other Mac users to solve crashing
problems by eliminating extensions one at a time.

On the other hand, I've never even seen a driver "conflict" on a
Wintel machine. Please elaborate.

No, it's more like running your graphics board under Win in
plain VGA mode. The Mac is always in basic mode; it doesn't
use things like polygon fill, even if the graphics board can do
them. Arguably, that stuff belongs in a coprocessor, like
the QuickDraw 3D accelerator, rather than in the graphics
board, but Apple has been notorious for building machines with
sockets for wierd kinds of video coprocessors and not building
anything to put in them. (If you have an "AV" machine, you
know about this.)

I'll respond for David on this one. What he is say is that you CAN
expect all the screen to be doing something different from one another.
As for having much use, try this one: Imagine having a Photoshop image
displayed on a 20 inch monitor at 24-bit color depth while all those
otherwise annoying floating menus that Photoshop loves to display are
all by themselves on a second 17 inch monitor running at 16 bit color
depth.
True there's lots of mousing around necessary, but it's worth it for the
extra real estate.

Right, *they* are idiots.
In that case, so are the groups from ATI, Ascend, and IOmega among
others. Because each of those companies have Mac devices which
require a driver.

>I have NEVER seen or used any Nu-bus, PDS, or PCI
>video cards on the Mac which require any software (other than the what
>is inherent in the OS) to run them.

And since you've never seen them, they therefore do not exist or if
they do, the people making the devices are idiots. Great line of
logic.

Because like Conflict Catcher, uninstallers address a very real
weakness of MS Windows.

Just like Conflict Catcher, you have RAM Doubler--addressing a real
limitation of MacOS. And on the Windows side, you have dozens of
shell "enhancements" (ala, PC Tools, Norton Desktop, DashBoard,
etc...).

>>On the other hand, I've never even seen a driver "conflict" on a
>>Wintel machine. Please elaborate.
>
>Then you haven't been using PCs very long.

Sorry, there is rarely a driver conflict. Drivers do not stomp on
each other--simply because it's awful hard to shove two video drivers
into the same machine at the same time. What does happen is that
drivers are either buggy or the hardware isn't supported.

Chris, you're describing IRQ/BaseIO conflicts. These aren't exactly
the same as having two drivers stomp on each other. These are
strictly hardware limitation.

>I think when drivers are shoved into the same kernel space, there is a chance
>that conflicts do exist.

On the PC, if there is going to be a conflict in kernel space with
drivers, the drivers can't be loaded--it's just that simple.

This is getting silly enough. Both the PC and the Mac has some kind of common denominator in the video that allows a video card made to that denominator run without a driver. In the PC we call it VGA or SVGA or VESA, and you can run a Matrox on those modes without the Matrox driver. I have no problem running the Matrox Millenium on 640x480 on 256 colors with DOS games without a dedicated Matrox driver, nor using OS/2's GENGRADD, run the Matrox at 1024x768 resolutions up to 16 bit color *without* the Matrox driver. (Not possible with Windows however.)

The drivers, on the other hand, are needed if you want to fully exploit the specific capabilities of the Matrox card---hence your true investment on that card. Otherwise you are just better off buying a cheap video card.

Before under Windows 3.1, I tell you one thing---I had conflicts involving the ATI Mach 64 driver with another driver trying to use COM4. There are video drivers before that reserve certain I/O addresses and COM ports. Network cards and sound cards also compete for available IRQ and I/O addresses. I once had a EIDE driver that didn't like my video card driver as well (happened once in Windows 3.1, then in a totally seperate occassion, in OS/2.)

I think when drivers are shoved into the same kernel space, there is a chance
that conflicts do exist.

Yes, you can boot Windows 95 from Zip drive and CD-ROM drive. Most newer motherboards in the last one year has Bios that supports bootup from CD-ROM drive.

If you spend the time and money to get a Win95 bootable CD burned, yes
you can certainly boot Win95 from a CD. Most decent SCSI controllers
will allow you to boot from a CD--almost all of the new motherboard
BIOS will allow you to do the same.

However, while the Mac has a bootable CD widely available, Win95
doesn't. Which is the reason why I made the comment.

That's why it was a shockingly recent development. In any case, the
Amiga insists on closing all windows on the WB prior to changing WB
resolution, which can be a bit annoying if you use that as your main
public screen.

> These things have been taken for granted in most modern oses for years
> !

YEP,
MOST PEOPLE WHO USE MACs HAVE NOT NOTICED THE CURRENT MAC/OS HAS A
DIFFERENT "multitasking" THAN (1) PREEMPTIVE MULTITASKING
(2) ETC.
(2) ETC.
(2) ETC.

LIKE YOU THEY ARE AMAZED HOW MAC USERS WORK ON TWO/MANY PROCESS AT ONCE -
EG. FORMAT FLOPPIES & HARDDISKS, DOWNLOAD & PRINT VIA PPP, ARA, IPX RUN
WIN NT APPLICATIONS AT PENTIUM SPEED, APPLE][AT FASTER THAT REAL
HARDWARE, RUN DOS7 & WINDOWS 95 ALL AT THE SAME TIME (THE COPY PROGRESS
BARS MOVE WHILE THE REST GOES ON!

YEP ALL AT THE SAME TIME!!!!!!!!!

I HAVE HAD 31 CRASHES SINCE INSTALLATION AND RUN 28 EXTENSIONS ON STARTUP.
THIS 88MB 150MHz 604 (MORE POWERFUL THAN A PENTIUM PRO 200MHz in
Bytemarks) is now 7 months old.

Yep you should be amazed the current MacOS does all that without etc.
etc.etc.etc.

But it still holds years of advantage over Win NT and DOS7 & Win95.

It was 32bit long before Windows NT and as well all know Win95 is not a
true 32bit operating system.

I am more amazed how few DOS7 & Win95 users can copy files from different locations concurently.

By the way - without any addin PCI card I background my high speed comms at 115,200. Is that slow?

I use all characters but the ":" in my filenames!!!
Do you get amazed at that??
I wouldn't be amazed if MS-DOS/NT/UNIX users couldn't I bet like the Mac users they don't miss the little differences!

I don't however recall that the Windows 95 CD ROM itself is bootable.

Nope it isn't.
The Win95 CD actually has all the setup files in a compressed format
(.CAB files). It also has a bunch of documentation, drivers, etc...

To boot Win95 from a CD, you'll have to burn one.

Yes, I mean Windows 95. You just need to burn in the system and Windows
95 files to the CD-ROM.

You need to copy (burn in) the system files in the root directory and
the Windows 95 folder to the CD-ROM. And this CD-ROM is bootable when
the Bios supports it.

You got this mixed up with the Windows 95 Installation CD-ROM.

Power without the Price was Atari's idea for a slogan. And a load of Crap. It defies logic and goes against All the Laws of the universe. Like "A Man is worthy of His Hire." and "You get what you Pay for." and "If it sounds too good to be true, It's probably a Lie." and in Atari's case, "You sow what you reap" aka "What goes around, comes around." Atari trying to appeal to cheapskates was it's undoing. Don't punish Toad because of an Atari Slogan. They're trying to support Atari, stay in business and feed their families. I just received a Toad-M SwitchBox which will let me use a MultiSync Monitor on my Atari ST to do Color and MonoChrome on the same MultiSync. This will also be the Last one Toad makes as their Technician is leaving because not enough people wanting to keep him Employed with a DEMAND for work. I know about the Crap that Bonafide Atari dealers put up with. And how many don't appreciate them. I blame it all on Atari, especially their slogan "Power without the Price!"

:>NT seems to be good ride right now, too.

I think NT is overrated. For an industrial strength OS it seems to have a few stability holes. I hate to see people support MS if they don't have to. MS is trying to replace open standards with proprietary MS standards, that alone is reason enough to stay away. What Microsoft wants, and you can see this by looking at NT server setups, is an MS server with MS clients. The clients can be nothing more that Windows "terminals" controlled by the sys. admin. All software can be monitored, installed, and usage tracked, from a central location. Now this is not inherently bad, but it smacks of the IBM mainframe and dumb terminal paradigm that everyone complains about. Lets face it. MS has become IBM. At least IBM has made Warp compatible with open systems, i.e. TCP/IP, OpenDOC, CORBA, Java. etc.

Wooow I should have bought a PCI Mac, and then add a PCI ATI or Matrox card.
(Never had a Mac that used an add on video card before.)

The only way that's possible is if the video card was designed to follow a tight
spec set by the software set within the system itself, and not the other way
around. The actual "driver" of the card must be in a ROM within the card
itself.

Idiots because we realize that there has to be something around telling
that ATI Rage II not to act like a Cirrus Logic 5428. The OS may just
hide it from you but, it needs to be lurking in there somewhere.

>video cards on the Mac which require any software (other than the what

>sense of the word.

...until someone comes out with a new chipset...

oops... time for another OS revision, so they don't realize they
got autocad drivers under the hood... '-p

BTW, according to your twisted definitions, Win95 (and probably NT) still
supports Multiple monitors. The dirvers are sitting right their with the
rest of the STB drivers. We can even look through them so's, we can make
sure that X card wont be stuck in nothing but vga modes...

Quite an elaboration... I must've missed those examples you just gave.
What were they again?

>
>Sure... and those OS's (WinNT) don't work with Plug&Play.... so it
>abstracts the hardware a little - but you have to plug in custom

It abstracts it sufficiently enough that a 500Mhz Alpha will
run at full native speed. Considering that MacOS would not
be capable of doing so, that is an acceptable tradeoff. Really,
what's the point of buying an X704 just to run an OS that's coded
in 68K?

>drivers to use it, and if you configure it wrong (which is easy to do)

>subjects like that is called a "dodge". Nice try though.

You were the sorry fool that mentioned HAL's. That IS what HAL's
are for you know. If the MacOS had one, it still wouldn't be running
parts of it's OS as 68K.

>

Shitty compared to VMS != Shitty when compared to MacOS.
If you insist on such comparisons then MacOS looks very much
worse than it already would.

So? What's it missing in respect to VMS and Unix? Do tell?

>
>Win95 which runs on more of the Wintel platforms has crappy plug&play
>compared to the Mac... has weird compatibility issue with older apps.

The only compatibility issues that arise are due to tighter system
protection. Programs break when they don't behave nicely. This,
ideally, is what an OS is supposed to do.

Win95 plug-n-pray is of course crappier. There is much more for Win95
to do. It has to deal with hardware that could concievably be older
than any Mac or Lisa in existence. Win95 fails when compared to MacOS
in this regard; it also attempts to achieve more.

Subject yourself to MacOS limitations and the vast majority of those
problems should dissapear.

>Runs on DOS - but a little less than the past. Has shitty memory
>management issues like those low-mem shared globals for GDI/MDI that
>you can fill up and crash the system, it sometimes is CMT and

Dunno about that. I push systems past the edge and I've yet to
run out of USER or GDI segment space on a Win95 box. Perhaps you
could provide some examples? Just what were you doing in Win95
when the GDI dried up? That way we can all reproduce it...

>sometimes PMT... it is the bastard child of all MS OS's that came
>before it, and is typical MS hacked up garbage.

The only problems I really have with Win95 is large scale file
management. Moving around 100M+ or 1000+ files tends to clobber
the explorer. I have the same problems with Moxfm, however.
Neither can acutally crash the system however...

>

>thats THEIR fault - no one elses.

You are truely clueless.

No amount of cursing, wishing, or praying is going to keep an
OS from NOT being at the mercy of the hardware it is running on.
This 'hardware' also includes the BIOS.

Those fiddly bits are not going to magically jump off, run over to
the disk controller and start it up. THAT bit of magic needs to be
on the mainboard. Until those fiddly bits have finished thier job,
even VMS is at their mercy.

None of your whining is going to change that.

It is little wonder that a Macindroid is incapable of making the
distinction between hardware and software here. There is plenty
that MicroSloth can actually be blamed for. Go hark upon that
instead of making the Mac look foolish.

When Microsoft starts manufacturing BIOS chips, then you might
be able to complain.

There is nothing to abstract at that point. The entire bootstrap
process occurs before the OS even has an opportunity to get to the
system.

Even an honest Microsoft hater would defend them upon this point.
There is really no need to invent things against them. Such
dishonesty only paints them as a sympathetic victim.

You are doing that quite nicely...

For an engineer, your lack of understanding of the hardware you are
using is quite appaling. If you have a PE (or any other) licence it
should be REVOKED!

As an engineer, trained in science, I can judge the universe based upon
my observations. My observations to this point have not yielded anything
reproducible. Therefore, I can neither confirm nor, deny your babblings.
Since you don't even understand the rudiments of a computer's bootstrap
process, it would be a fair assumption that anything you say is bogus.

The some total of my observations may change at some later point in time.
At which time, my conclusions may need to be revised. However, I don't
think that there is much likelihood of that happening.

'better' is a qualitative statement.

>window on a seperate monitor dual monitor support in the way people
>want to use it).

It seems that you aren't willing to actually ask people how they
want to use it. Furthermore, THAT wasn't the only solution stated
by myself (or others). STB has solutions available and those are as
plug and play as any Mac solution.

Furthermore, monitors beyond the 30" size range are quite commonly
available in 'engineering'. In that domain, multiple monitors seem
more useful as a gimmick than anything else.

>
>> You have no basis for this assertion. If MacOS is so

>hits even harder), the Mac cuts angles on hierarchical menus better,
>the Mac handles scrolling menu's better, Macs handle menu updates

The value of scrolling menus is nil. You have taken a device
useful in limiting information and turned it into a storehouse.
If you want to bombard users, you can just forgo the GUI and
bombard them with man pages.

>faster/smoother, etc., etc...

There's not that much on a menu to handle, or rather there
shouldn't be.

>blindly argue that its OK because MS is great and their shit doesn't
>smell... etc., etc...

Some shortcommings are more significant than others. Of course you would have to hark upon the most superficial problem with VFAT, ignoring the more significant ones, the ones that can actually cause problems.

Given the choice between forgoing colons in my filenames vs. loosing data, I'd dump the colons...

In Wintel this is called VGA.

So much for the myth; that explains quite a bit now.
Plug-n-play doesn't seem quite as impressive when one
realizes it is nothing more than a warmed over version
of VGA. Admittedly, such a thing is useful but, it is
hardly remarkable.

Macintosh: It will be plug-n-play but, only if it's a vga card...

6916. Atari Prototype Auction #1

Newsgroup: comp.sys.atari.advocacy
Date: 1996-12-26 00:00:00 UTC
From: Curt Vendel <cvendel@aol.com>
Message-ID: <32C2D2B7.2CEB@aol.com>
Source record: 7175

ATARI PROTOTYPE AUCTION #1:

The following RARE items are available for auctioning.

RULES: Bids start at specified price and will go up in $10 increments. Updates will be posted daily to all bidders. Auction will go until Jan 10th 1997 and will then enter the GOING, GOING TWICE, GONE stage. All bidders who make it to the GONE section of the bidding are responsible for shipping costs. All items will be shipped PRIORITY ONE MAIL. Please don't bid unless you are serious about buying. All items are sold "as-is" and there will be no returns and/or refunds. No items will be shipped until payments are received and cashed.

Atari SALT Diagnostic Module: Enclosed in an Atari 850 interface, has 1 Serial SIO port, 4 Atari RS232 ports, power input, an RCA plug where the Parallel intreface would normally be, and 2 14 pin chip sockets, an HP seven segment ultra-bright LED display and reset switch. Unit powers on and doesn't cause any Atari that was hooked up to it to freeze. Salt Diagnostic ROM or disk software required to activate and use this unit (NOT INCLUDED), picture available on my web page upon request. (3 Available) Minimum BID: $50.00ea.

Atari XL Salt Diagnostic Module: Enclosed in an Atari 850 interface, unit has PBI cable comming out of right side SIO connection cut-out of 850 module for testing parallel bus interface.
Salt Diagnostic ROM or disk software required to activate and use this unit (NOT INCLUDED), picture available on my web page upon request. (1 Available) Minimum BID: $75.00

EXTREMELY RARE: Atari 6402A Prototype Motherboard (only 3 exist!!!) Prototype motherboard, apparently a test bed which has all the same components contained on an Atari 1450XLD "TONG" version motherboard including disk drive controller area, modem area, SC-01 voice synthesiser, Parallel Bus Interface. This unit has ports positioned on all 4 sides and does not appear to be a "commercial" product but appears to be more of a test design to condense the Atari 1450XLD TONG motherboard down to about 1/2 the size, (unit is NOT functional)
Minimum bid $120.00
Image will be posted on my webpage upon request

Atari XE Game System 8 port multicart prototype board:
A prototype test board which may have been a pre-design idea to allow the XE game system to contain and select up to 8 cartridges (this of course turned out to be built in BASIC and MISSLE COMMAND in the released version) The board is about 8" by 12"
Minimum Bid $50.00

Image will be posted on my webpage upon request

Atari XEP-80 Prototype:
Atari Corp design prototype of the XEP-80 system. Design consists of a mainboard, daughter card, DB-25 connectors and Atari joystick interface cable, this unit has never been tested and I am not sure if the current commercially released XEP-80 software will work on this pre-design prototype.
Minimum Bid: $75.00
Image will be posted on my webpage upon request

Make all bids and requests for images to:

Curt Vendel

> An ATI 3D Expression+TV ?

I don't know Mr. JEDI. Does ATI make a version of the 3D Expression+TV board
to work with the Mac? If so, I will gaurantee that it doesn't need any drivers
to display any resolution, screen size, or any bit-depth that the board
displays.
It probably would need a control panel for the TV part and possibly the 3D part,
however. But, if you think I am trying to say that Macs never need enabling
software for add-on boards or other peripheral devices, then you haven't been
paying attention. Macs don't need drivers for monitor video cards to display
video at all supported bit-depths, screen sizes or resolutions PERIOD! No
other functions are either stated or implied by me.

> (Never had a Mac that used an add on video card before.)

That's funny, there have only been Macs which can use add-on video since 1986!
The first Mac II, the Mac IIX, the Mac II CX, Mac II Ci, Mac II FX,
various six slot
towers such a s the Quadra 900, 9100, 9500 had NO on-board video. One had to
use plug-in add-on video cards. Any Nu-bus or PCI or PDS (processor direct slot)
Macs can use add-on video cards. Most don't require them, however, unless one
wanted to drive a larger monitor at a higher bit-depth than the on-board video
allowed

>
> The only way that's possible is if the video card was designed to follow
a tight
> spec set by the software set within the system itself, and not the other way
> around.

I have been saying that for more than a week in this thread. The system contains
all that is necessary to drive all Mac compatible video boards, whether you are
running just one monitor, or six contiguous monitors (that means that the
computer
treats all of the connected monitors as if they were one big virtual
monitor. The
cursor will move from one to the other accross the screen boundries as if the
boundries weren't there) -of course you need a Mac with six board slots to
do that
(like a 9500). Most Macs, PCI or Nu-bus, only have three expansion slots and
"pizza-box" Macs only have a PDS slot.

The actual "driver" of the card must be in a ROM within the card
> itself.

I don't know. Its a non-issue to the user. It just seems like a much
more elegant solution than the Windows route (but, then, isn't
almost anything?) ;<)

> Macintosh: It will be plug-n-play but, only if it's a vga card...

Wrong. Mac Video is NOT VGA! Not only that but video plug-n-play
has been a fact on Macintosh SINCE 1986! (so who has warmed-
over what?), and 24-bit color has been available on Mac since
1987.

Plug-n-Play on the Mac is sooo much more than that! Its
plugging in a scanner and having it work first time every time
Its putting a 3D renedering board in a PCI slot, droping an icon
on top of the system folder (where the system then tells you

where its going to put the Control Panel or Extension and why),
and then restarting the machine. The new board is recognized
INSTANTLY, and EVERY TIME!!!! Try that with MS 'Plug-n-Pray'.
And, if its not so remarkable, how come PCs can't do it
reliably, and how come they left it out of NT altogether?

"Enquiring minds WANT to know"!

Wrong! Mac video cards are written to the Mac video spec or they don't work
at all. That spec has not changed appreciably since the advent of 24-bit color.

How do I know this? Because NO video card I have ever seen comes with any system revision cavaets per se (obviously, a PCI video card won't work with a system that doesn't support PCI, but that's another issue, having nothing to do with the video spec itself). If you want further proof, go to a library and take a look at the book(s)* "Inside Macintosh". It (they) contain all of the
info required for anyone to write software or build hardware for the Mac. You'll be surprised how little the Mac video spec has changed over the years.

I don't understand what you are getting at in the above paragraph. Please illucidate. Thanks.

George Graves

*"Inside Macintosh" has been published as many volumes with new ones coming out to cover new enabling technologies as they emerge (something you W/Intel folks never have to worry about;<)). But compendiums of the set covering only recent models (with pertinent information from earlier volumes included) also exist. So one might be confronted with a single volume or multiple volumes going all the way back to the original Mac 128.

In 1988, the cheapest PC Clone available in my area was an (PB)
8Mhz, 8088, w/ 640k & 10Meg HD, dual 5.25 floppies and a cga card.

It cost $1000.

A 520ST (w/ SS drive) cost $300.

Despite the appearace that that Clone outspecs this ST, the
ST ran circles around that machine and was quite a bit more
useable.
```

Just because you can't manage it now; it doesn't mean that it never was.

Power without the Price, existed once.

It is not a far stretch to say that that is why many of us are here.

Translation: You need to use the Macintosh Analog of a VGA card.

It's a good thing you warned the world about this.

We might have actually gotten the false impression that Macs
were now as expandable as PC's and capable of accepting all
those nifty PCI cards.

You've saved the open minded among us a lot of wasted time, money
and effort.

Now that we've exposed what a paper tiger that Apple Plug-n-play
is we can all feel secure in the knowledge that if we really want
the (new) mac enviroment, all we have to do is buy NextStep or wait
for GNUstep to be 'finished'.

PC: The Mac of tommorrow, Today! '-p

>at all. That spec has not changed appreciably since the advent of 24-bit color.

What? No 2D acceleration? No 3D acceleration?

That's one static rotting old spec there...

>illucidate. Thanks.

The vast majority of PC video cards are as plug-n-play as any mac
video card. At that level, the same system design idea pervades both.

Installing a new video driver is all point and click.

The original release of Windows95 includes drivers for multiple frame-buffer cards. I found ones for the STB dual and quad. There may be more but, I didn't check any farther.

Just point and click your way to the name of the driver, put in the installation CD (additional, but trivial step) and you've got 2 or 4 distinct displays.

Fortunately, Windows functionality is not merely limited to that which BillyBoy ordains.

Think of us as EastAsia.

(although it's hard to keep them straight really) '-p

Thanks.

Unfortuantely, I seem to have lost the ability to start documents from the
command line if I use 4NT.

"start blah.txt" or "blah.txt" no longer seems to work. :(

Sigh.

It's a hopeless battle. There will continue to be FUD floating around
the 'Net about ehich chip is better.

Why is PowerPC superior to Pentium/Pentium Pro?

1) More of a future. CISC is dying, and the PPro's double-die was
incredibly sophisticated. The next iteration will have to be even more
difficult.

2) Transition is already done. There will be yet another wave of
upgrade mania and incompatibilities gripping the PC userbase when Intel
finally migrates to RISC to stay competitive. This will cause even more
confusion than exists now in the three-OS "Windows" market.

3) Higher performance in the very near future. 300 and 530 MHz PowerPC
chips are currently available, and major leaders in the computer
industry are rushing to use them.

4) NeXT is the new Mac OS. The next generation of the MacOS will be
more stable, easier to use, more refined, and more powerful than
anything on an Intel chip, will be running on faster, more efficient,
RISC-based PowerPC chips, and will offer considerably more "native"
applications than whatever OS MS is offering.

Facist & Cowardly. You mean, besides the fact that apple had to
good sense to document how they were going to do cards? Let's face
it, I have yet to be able to go a solid week, without hitting some
problem with Plug & Pray. Apple specified which cards would work
and how they would work when they introduced the nubus. As for the
rest of the PCI stuff, remember how backward the i86 system is.

It is amazing that any cards work. Apple may not be at the head of the
pack with OS software, but their hardware is much better then the PC's
that are out there (and I am writing this on a pentium pro 200).

]
] All of this is rather easy to do when you so brutally restrict
] what the system will accept. You're really lowering the bar,
] nothing more.
]
```

Actually, the MacOS accepts a wide variety of video hardware. The only restriction is that a device driver is provided that provides interfaces to set the resolution, refresh rate, bit depth, color tables, etc. In addition to the many various NuBus and PCI graphics cards supported, Apple develops new and different video hardware with new generations of Macs and PowerBooks.

```
] A PC can use Scanners and 3D boards that simply wont work with a
] Mac, no matter how hard you try.
]
```

Generally, this is because Mac drivers are not provided by the manufacturer, not because of some restriction in the MacOS. Unless, of course, not supporting Windows drivers is considered a restriction :)

```

] a clever way to stack the deck. Apple has ordained what it will
] support and left the rest to rot. There is nothing remarkable in
] this restriction. When held up to the light, it acutally looks
] rather fascist and cowardly.
]

As far as video display cards, video digitizers, sound cards, SCSI cards, and networking cards go, I don't know what Apple has done to stack the deck and left developers to rot (unless we're stacking the deck by not supporting windows device drivers). Apple itself has developed many different versions of the above hardware in our own products (we've even been dogged for changing our hardware too much) and supports an even greater array of 3rd party hardware, all with plug and play (I assume your use of "Windows Plug & Pray" was a slip).

] What computer was born in 1984?

Wasn't the PC born in 1981? Of course, the PCs and Macs today are quite a bit different that then.

I don't think the point was that Windows was limited to C: and D:
drives as far as non-system drives is concerned, but Windows does have
to be installed on a Primary partition. And since only one primary
partition can be active at a time, that means it is C:. You most likely
wouldn't have a removeable drive as your primary boot drive, therefore
that drive would be D: or E: etc. OS/2 on the other hand can be
installed on any partition using bootmanager (but HPFS can't be
installed on a removable drive..at least not without some magic tricks.)

The Mac doesn't use drive letters, so the Mac System can reside on any
drive, even a removable drive. You could plug your drive into another
Mac and tell it to boot the system from the new drive and you are in
business.

If you tried to do this on a Windows PC, the new drive would most likely
not be C: and therefore WOULD NOT BOOT.

"Slightly" better scheduler and protection scheme?

Ahem. :)

"Slightly" better then MacOS7, which has poor and none. :)

>Everyone with a room temperature or above IQ, and who has seen a Mac

While I agree that the Mac has better multiple monitor support than the
PC, it is wrong to say that the PC doesn't have it at all.

Try:

http://www.appiantech.com/a2.htm
http://www.appiantech.com/j2.htm
Dual monitor support for NT and 95 using dual Appian video cards.

http://www.matrox.com/mgaweb/brochure.htm
Note where it says multiple monitor support for NT under "Ultra-High
Resolutions & Colors" section.

>faster/smoother, etc., etc...

Actually, I don't like the way the Mac has it. Personal preference really.
I like to have a visual association between the app and its menu. I find
it less confusing overall.

When is the Mac going to get a decent keyboard interface for the menus? Most of the time, I use a Windows program with one hand on the keyboard. (Two if it is an editor or word processor. :)

On the Mac, I find it a lot harder to do this without looking up esoteric Command-Key combinations because Windows menus *display* as I use the key combinations, unlike on the Mac. sigh.

Personally, though, I'd prefer context sensitive right button menus (which I can also get to via Shift-F10 (or some key combination) if necessary).

Ideally, the top menu bar really only *needs* six options: Create New, Open Another, Send To, Save Changes, Save As Another Document, and Discard Changes.

Send To should have "E-mail User", "Printer", and others as sub-options.

Other *document* actions can go here as well as on the context menu for the desktop icon for the document.

You shouldn't really use Open, because you can just open a document from the desktop by double clicking, or by using its right button context menu. (This works for things like network connections as well - treat a network connection as a document on the desktop.)

You shouldn't really use New, because you create new documents by dragging from a template or using a "Create New..." option from the desktop right button context menu.

All other menu options should removed from the top menu and instead be tied to context sensitive right button menus for the objects that they are valid for. Global tools should be available in floating dockable toolbars, with automatic flyout textual names.

For example, if I want to make a line of text bold in my word processor, I'd select the text, click the right button on the selection, and click bold on the context menu. Easier than selecting the text, moving the mouse all the way up to the top of the screen, then looking for "Format", clicking it, looking for "BOLD" and clicking it.

As another example, what if I want to cut a piece of text. Select the text, right click on the selection, look for and click "Cut".

Easier than selecting the text, going all the way up to the top of the screen, looking for and clicking "Edit", then looking for and cliking "Cut".

Let's say I want to go back a page in my WWW browser.

It is easier to right click anywhere on the page, look for and click "Back" on the context pop-up menu.

It is harder to find the "Go" menu at the top of the screen, move the mouse all the way up to the top, click on it, then look for "Back" and click on it.

It is harder, as well, to move the mouse up to the Back button on the toolbar. (Though even the toolbar is a better solution than the top menu in this case.)

If I want to spell check a document, I right click anywhere blank on the document page, and select Spell Check from the context menu. Simple.

The idea is that if I want to work with a "something", I don't need to move the mouse all the way up to the top of the screen and read or rummage about with menu options that have nothing to do with manipulating a "something".

This simplifies the UI for the user, since actions which are not relevant, are not displayed, and mouse movement is reduced a lot.

It frees up screen real-estate, since no unnecessary menus are available.

Furthermore, all actions are directly associated with
what they are acted upon.

Once the user discovers the basic concept of "select the thing you want to change, and click the right mouse button", things become simple, and fast.

Windows is closer to this than the Mac is, though. OS/2 is closer than either of them, but OS/2 has other UI problems. :(

UI design is, of course, a very subjective thing. My version of the ideal UI can, and probably *is* different from yours. :)

>holes.

Sure NT has holes.

So do all unices (as evidenced by the large number of CERT reports
that seem to arrive in my mail box)

So does public key encryptation (eg: the Kocher attack)

So do AIX systems (the notorious login -r bug , eventually fixed by
IBM after it was described on the net comes to mind)

So do AS400 systems.
(BTW, a client who worked as a systems engineer on AS400 systems
claims that most of them still have the original 5 letter systems
engineer password on them. He claims that he telnetted across the
world across corporate systems using this .... go figure ...)
No , I am not going to post the 5 letter password here... although
hunting through old issues of phrack sure is informative.... :-)

Heck if your secrets need Fort Knox type security, put them IN Fort
Knox !

If you absolutely need a crashproof system, invest in a fault tolerant
Tandem system with dual controllers, mirroring, dual cpus ,
dual everything and have a parallel system connected by fibre optics
mirroring your original but placed miles away.
Then sit back , pray and prepare for the inevitable crashes ! That is
what the TPC intensive sites (banks, Visa , stock markets) do.

No, little old NT simply is not in the same ball park...
But it and Linux sure are stable enough for my simple needs...

Nah, it'd probably come bundled with Windows 95. :-)

It makes a PCI version of that card actually.
Since the current macs claim to be able to use PCI card's,
then your spiffy mac should be able to handle it.

This should be the case regardless of whether or not that
particular PCI card is nothing more than an Uber-VGA card.

>to display any resolution, screen size, or any bit-depth that the board

In other words: Mac Video Cards are plug-n-play so long as they
conform to the Apple equivalent of VGA.

WHO CARES!

PC's had 'plug-n-play' of that 'sophistication' long before macs did.

I have been paying attention... all too well.

WHO CARES!

PC users view VGA cards as about as useful as you would appear to
view hercules cards. It also seems bizzare that anyone who would care
about high end parlour tricks would settle for VGA++ of any kind.

You've shown Apple Plug-n-play for what it really is...
...a set of cloning standards.

Even Billy-Boy could manage plug-n-play in such restrictive
circumstances.

[deletia]

Yes, quite elegant:
restrict user choice to the point that integration is trivial.

It's positively Orwellian.

So, call it VGA++. It is still the same essential idea as
hercules, cga, ega, mcga & vga. The Spec is castrated to
aid in integration. It may be a good design descision but,
it's nothing to brag about.

>
>Plug-n-Play on the Mac is sooo much more than that! Its

All of this is rather easy to do when you so brutally restrict what the system will accept. You're really lowering the bar, nothing more.

A PC can use Scanners and 3D boards that simply wont work with a Mac, no matter how hard you try.

If PC hardware were so constrained, PC integration would be no less difficult.

>INSTANTLY, and EVERY TIME!!!! Try that with MS 'Plug-n-Pray'.
>And, if its not so remarkable, how come PCs can't do it
>reliably, and how come they left it out of NT altogether?
>
>"Enquiring minds WANT to know"!

Why? Because PC's support a greater diversity of hardware, a greater diversity of bus options and aren't merely limited to cloning someone else's spec.

They aren't merely limited to IDE boards, VGA cards, Sound Blasters and the like.

Windows Plug & Pray attempts to achieve much more than the Apple version ever dreamed of. The Apple version is nothing more than a clever way to stack the deck. Apple has ordained what it will support and left the rest to rot. There is nothing remarkable in this restriction. When held up to the light, it acutally looks rather fascist and cowardly.

What computer was born in 1984?

The PC heads think VGA is a default 640x480 screen with 16 or 256 colors.

But that is a RESOLUTION.
```

Macs use a linear addressing video buffer from the very beginning if I recall,
and if I recall, VGA requires paging.

Yes it would need driver or extension or whatever you want to call it.

>
> It makes a PCI version of that card actually.
> Since the current macs claim to be able to use PCI card's,

How would any OS handle a card that was not designed for it either
inherently or through the use of driver?

>
> This should be the case regardless of whether or not that
> particular PCI card is nothing more than an Uber-VGA card.
>

Supporting the various Quickdraw functions is a lot more than just
supporting a dumb frame buffer.

> In other words: Mac Video Cards are plug-n-play so long as they
> conform to the Apple equivalent of VGA.

Mac video cards are plug-n-play as long as they conform to the MacOS's
guidelines just like a card made for the PC must have drivers that conform

to the Window's spec or whatever other OS you're running.

Macs don't need drivers for basic functionality. They can take advantage
of graphics acceleration without. Some cards need drivers though for
things that go beyond the Quickdraw spec.

> Now that we've exposed what a paper tiger that Apple Plug-n-play
> is we can all feel secure in the knowledge that if we really want

A card has software on the card itself to interface with the QuickDraw
engine

> What? No 2D acceleration? No 3D acceleration?

The card takes advantage of acceleration the same way it does with Windows, by accelerating the graphics routines.

> >info required for anyone to write software or build hardware for the Mac.
> >You'll be surprised how little the Mac video spec has changed over the
> >years.
>
> This is supposed to be a badge of honor?

If it was done right the first time yes it is. But Quickdraw 3D has been added to the spec the cards do take advantage of them.

> Fortunately, Windows functionality is not merely limited to that which
> BillyBoy ordains.

This whole argument is pointless. The driver's for the Mac on the card and the Windows's driver's are installed separately. There is really know difference in the functionality.

6945. Re: Power Without the Price, No more (Re: Toad Christmas SPECIALS -- through 12/23/96!!)

> especially their slogan "Power without the Price!"
>
> ==Thanx==
> ===Ben===

Ben, I used to hate it when people said that Atari was dead. But now
its true.
There is no more Atari computer company. Your 'Multisync Switch Box' is
not
only totally unnecessary on new equipment (the need for such was just a
way to
sell monitors anyway), but you can make one yourself with a small platic
box
and a rotary switch. Total cost about $5-$10 and 30 mins to an hour of
work.
So, forgive me if I'm not floored at the loss of the WonderTech and his
super switch box.

Toad prices suck. All Atari prices such. A Pentium 90 w/512K cache,
dual EIDE
controllers, dual 16550 UART serial ports, parallel, full PCI, etc, is
$250!
Add a case, hard disk, monitor, and keyboard - all of which can be had
at your
local sidewalk sale for pennies, and you have a decent machine. Add
Linux for
an OS and you never have to look at MicroSloth either. I hate Intel,
but the
ST just doesn't have the power, and its WAY too expensive to upgrade.
That's
why I dumped the Atari 8-bit - upgrade was too expensive. Now there
isn't any
cheap Atari to upgrade too. Sure a Hades would be great, but if I was
gonna
buy another unsupported piece of hardware, I'd get a BeBox - at least
that has
some upgradeability and a decent price point.

CYA,
Evan

6947. Atari Prototypes Auction #1 (Update #1)

Newsgroup: comp.sys.atari.advocacy
Date: 1996-12-29 00:00:00 UTC
From: cvendel@aol.com
Message-ID: <19961229153000.KAA09669@ladder01.news.aol.com>
Source record: 7006

ATARI PROTOTYPE AUCTION #1: (UPDATE #1 12/29/96)

The following RARE items are available for auctioning.

RULES: Bids start at specified price and will go up in $10 increments. Updates will be posted daily to all bidders. Auction will go until Jan 10th 1997 and will then enter the GOING, GOING TWICE, GONE stage. All bidders who make it to the GONE section of the bidding are responsible for shipping costs. All items will be shipped PRIORITY ONE MAIL. Please don't bid unless you are serious about buying. All items are sold "as-is" and there will be no returns and/or refunds. No items will be shipped until payments are received and cashed.

Atari SALT Diagnostic Module: Enclosed in an Atari 850 interface, has 1 Serial SIO port, 4 Atari RS232 ports, power input, an RCA plug where the Parallel intreface would normally be, and 2 14 pin chip sockets, an HP seven segment ultra-bright LED display and reset switch. Unit powers on and doesn't cause any Atari that was hooked up to it to freeze. Salt Diagnostic ROM or disk software required to activate and use this unit (NOT INCLUDED), picture available on my web page upon request. (3 Available) Minimum BID: $50.00ea.

BID: $50.00 MKyle

Atari XL Salt Diagnostic Module: Enclosed in an Atari 850 interface, unit has PBI cable comming out of right side SIO connection cut-out of 850 module for testing parallel bus interface.
Salt Diagnostic ROM or disk software required to activate and use this unit (NOT INCLUDED), picture available on my web page upon request. (1 Available) Minimum BID: $75.00

BID: $75.00 MKyle

EXTREMELY RARE: Atari 6402A Prototype Motherboard (only 3 exist!!!) Prototype motherboard, apparently a test bed which has all the same components contained on an Atari 1450XLD "TONG" version motherboard including disk drive controller area, modem area, SC-01 voice synthesiser, Parallel Bus Interface. This unit has ports positioned on all 4 sides and does not appear to be a "commercial" product but appears to be more of a test design to condense the Atari 1450XLD TONG motherboard down to about 1/2 the size, (unit is NOT functional)
Minimum bid $120.00
Image will be posted on my webpage upon request

BID: $120.00 MKyle

Atari XE Game System 8 port multicart prototype board:
A prototype test board which may have been a pre-design idea to allow the XE game system to contain and select up to 8 cartridges (this of course turned out to be built in BASIC and MISSLE COMMAND in the released version) The board is about 8" by 12"
Minimum Bid $50.00
Image will be posted on my webpage upon request
BID: NONE

Atari XEP-80 Prototype:
Atari Corp design prototype of the XEP-80 system. Design consists of a mainboard, daughter card, DB-25 connectors and Atari joystick interface cable, this unit has never been tested and I am not sure if the current commercially released XEP-80 software will work on this pre-design prototype.
Minimum Bid: $75.00
Image will be posted on my webpage upon request

BID: NONE

Make all bids and requests for images to:

They would understand it all too well, given full disclosure.
They used to refer to such things as VGA and EGA. If they
want to so restrict themselves in the name of ease, they have
the option to use such things.

However, they would all laugh in your face if they knew that
such things are what Mac Plug & Play is truely limited to.

The accomplishment, in reality, is much less impressive than
it would appear (Mac Clone & Play).

So much for the open bus standard...

Thanks for bursting our bubble. We thought now that one card
could service the same need on a PC, an Alpha clone, an Atari
clone (mebbe Amiga clone too) or even a Mac.

You've just reduced the situation to where it used to be.
Macs require their own special hardware.

>
>> What? No 2D acceleration? No 3D acceleration?

Since MacOS was not designed with ''oddities'' like the CL 5434 or
the ATI Rage II in mind, it wont be accelerating anything.

Plug & Play will disapear.

Precisely. In this manner, the fact that Windows 95 comes delivered
with driver support for multi-monitor video cards makes that functionality
just as 'built in' as it is for MacOS.

>
>>
>> This should be the case regardless of whether or not that

It would depend upon the hardware actually.

I also suspect that this 'standard' is just another instance
of VGA++. Everyone is essentially cloning the same hard-
ware specification.

Precisely. The MacOS requires conforming hardware. Everyone
else merely requires a conforming driver interface. It is not too
difficult to see here how complexity and choice are being
simultaneously restricted. One gains at the expense of another.
Options and flexibility are sacrificed for ease. In the end, what
is achieved is qualitatively and quantitatively different.

MacOS plug & play is not a superset of Win95 plug & play.
That should be well understood and freely admitted. Anything
else is pure fraud.

Users should know exactly what they're getting. They should
be capable of making informed choices. The Mac tendency
to hide important details quite interferes with this.

If anything: Win95 plug & play attempts to be a superset of
the Mac's.

>But that is a RESOLUTION.

Actually, VGA is a low level video spec. that also happens to include standard resolution and color depths.

Such cards are register level compatible with a standard driver that comes as a part of the BIOS on PC motherboards.

The design paradigm at work is identical to the one that drives Mac 'Clone & Play'. One driver ships with the machine and all hardware is expected to run with that driver.

One spec has a few more frillsl than the other but, that is it.

> functionality just as 'built in' as it is for MacOS.

You are delving into idiot areas....

Anyone who has used both machines knows that the Macs multi-monitor support is faaaaaaar superior to windows. <period>

With a Mac you can plug in multiple different off-the-shelf monitor cards, and have a virtual desktop of the union of those monitors - arranged as the user wished, and use them for various things. The system allows apps to request certain things - like highest res., most colors, etc. and work accordingly. The system also auto-dithers images across monitors, and knows which is the primary monitor.

The PC way is that App writers can try to talk to every known driver out there to try to figure out the same thing, and then features will only work one app at a time. Some cards support multiple monitors of the same resolution... but the system doesn't know shit about it. (can you say cheesy hack?!)

The Mac was is far superior. <period> MS is lazy, and implemented a bad (limiting) design.... and users pay the price.

> Precisely. The MacOS requires conforming hardware.
Everyone
> else merely requires a conforming driver interface. It is
not too
> difficult to see here how complexity and choice are being
> simultaneously restricted. One gains at the expense of
another.

Nope... people add by making their cards compliant with certain system restrictions... just like windoze. There are often FEWER restrictions on the Macs than on the PC's. So where is the cost?

Apple designed their stuff better... it took longer up front, and more money... MS just hacked it and called it "good enough".

> Options and flexibility are sacrificed for ease. In the
end, what
> is achieved is qualitatively and quantitatively different.

Yes... the Mac is better and more versitile, and works more the way people would like it to.

> MacOS plug & play is not a superset of Win95 plug & play.
> That should be well understood and freely admitted.
Anything
> else is pure fraud.

Superset? No... Win95 is a cheap hack that is meant to make up for a bad initial design (or lack of an initial design)...

The Mac is well designed, with versitility in mind.

Call Mac PnP a superset of Win95 PnPray is like calling a BMW a superset of a Model-T (with electronic ignition and after-market air-conditioning bolted on). Sure they both have wheels and a motor- but one is designed far superior than the other.

> If anything: Win95 plug & play attempts to be a superset
of
> the Mac's.

It may try... but it falls far short of success.

Mac PnP works.

What you mean is that you desperately HOPE that some TOS advocates
will claim this because you might actually have a good point and an
argument that might win for once. I know very little about NeXT but
I have seen bit of it in use and have only heared pleasnt things about
it. I didn't think that MacOS was going to be based upon it but I was
under the impression that NeXT was being developed for the PPc range
which I believe to be a better idea.

Quickdraw is no more a low level design spec than GDI or DirectDraw.

There is a driver API -- despite what some Mac users in this group seem to
believe.

Yes, with the proper extensions. Writing an extension to support various
types of hardware is well-known and well documented.

> the option to use such things.

The VGA and EGA specs did not provide OS specific routines to allow
advanced graphics handling. A Mac compatible card can and does accelerate
Quickdraw functions just like a PC graphics card provides GDI
accelerations. There is no difference.

No kidding.
Given that Apple has dictated exactly how the hardware must be
designed since 1984, I would be incredibly surprised if Macs didn't
support multiple monitors better than Windows/Win95/WinNT/OS/2.

However, this whole thing started because someone made the comment
that Windows/Win95/WinNT did not support multiple monitors. Nothing
about supporting it "better" than a Mac.

Windows/Win95/WinNT supports multiple monitors <period>.

By labeling someone based upon their nation of origin, you are engaging
in two of the most base of logical fallacies - nationalism and
regionalism. Neither contributes to your logos.

Perhaps, but TOS _IS_ superior in some key areas, including hardware efficiency and resource allocation.

It certainly isn't superior in support or speed, but, as you consistently fail to notice (or are retarded by feeble neurons from realizing), different people use different computers for different reasons. So for many people, TOS will be superior to MacOS 9 running on a quad PowerPC 609e 100 GHz machine.

This is quite a different story than the MacVocates are telling.
With them, video hardware either conforms to the low level
design spec or it gets left out in the cold.

To them, the concept of installing a driver of any kind, in any
way is completely alien. They rail upon this as a Win failing.

[deletia]

I personally haven't dealt with Toad since I met the Troy's at an
Atari show several years ago. They had a bin full of 8-bit carts that
were selling for $10 a piece (even though you could find them
elsewhere at the show for a buck or two). Anyway, I found a rare cart
in there and when they saw me looking at it, Mrs. Troy literally
snatched it out of my hands from across the booth and rudely told me
it wasn't supposed to be in the bin! I'd never had someone do this to
me before or since, even with all the hostile people I've dealt with
at flea markets over the years, and I was quite pissed! There could
have been another way to tell me the stupid thing wasn't for
sale...Anyway, I appreciate that they support Atari after all these
years, but get real...they have always charged close to full retail
for EVERYTHING, since the very beginning. How the hell did they
survive this long dealing Atari wares when all the good vendors fell
by the wayside?

Just my 2 cents worth...

Greg

It seems the Mac also has no small letters and it's keyboard sucks
(see how often the exclamation mark shows up above).

>But it still holds years of advantage over Win NT and DOS7 & Win95.

I have yet to see any of those systems making it's user unable to
avoid multiple exclamation marks and articles in (mostly) all caps.

Compared with Win NT and Win 95, MacOS is much worse. That's why
Apple bought NeXT - to get in advance again.

: _____
: Reachable at: 713 629 6947 nights
: Please quote in all replies
The Amiga doesn't always insist on closing all windows-this generally
happens when you have a screen behind the WB screen. If you just have
some WB windows open it will generally redraw the screen without any
trouble. Windows 95 makes you reboot to change screen resolution. As far
as I can tell, you can't run multiple screens in different resolutions in
Win 95, something which the Amiga does quite nicely. I've had to buy a
clone laptop for school, 120mhz Pentium, 24 megs of ram, 1 gig HD, 6x
CDROM, 1meg video ram (SVGA) 16 bit sound card, etc. Win 95 was preinstalled.
I've used it for a couple of months. I'm still waiting to be wowed by
this machine. I've run it out of memory, browsing the Web with one or two
apps in the background, something I've not done with my 18 meg 3000, As
for Win 95 memory protection, this is something I'm glad it has because it
really needs it. I will say Win 95 is much better that Win 3.1, but then
again AmigaDOS 1.1 was better than Win3.1.

Perceptually, this clone is not any faster than my 030 3000. I know that
it is many times faster hardware wise, but in everyday usage, the 3000
opens screens just as fast, I download and Web browse just as fast, it
prints just as fast on the same printer. Could I run 2 3D renderers,
print in letter quality, download at 28.8, decompress files from CD to
RAM:, all at once on this clone with out noticing any system degradation?1
I seriously doubt it. Could I do this on my 3000? Hell, I don't know, I
did it on my 030 2000 with 9 megs o' ram, testing a shareware task scheduler.

Win 95 has a long way to go. The only advantage I can see for the clone
is the variety of software, and you still have to separate the wheat from
the chaff...

In the mid-80's when Atari was using the slogan "Power without the Price"
It was true. You couldn't buy a better system for the money. The problem
is that the prices on Atari hardware became stagnant, while hardware prices in
the PC world dropped rapidly. For instance, in 1992 Atari released the Falcon
'030 (1 meg, no HD) for $799. Today toad is still selling the MK-I falcons
with the same specs for... $799. In 1992, $799 might have bought you a 286
or 386 system with 1meg and a small HD if you were lucky. Now you can buy
a low-end Pentium-class machine with 16meg RAM and a 850meg (or better) HD.

Add-ons are similar. For over $150, you can take your 8mhz ST to 16mhz with
an Adspeed. For about $50 you can replace a 66mhz 486DX2 with a 133Mhz 5x86
CPU on a PC.

I would love to have an Atari clone that was as powerful as my PC (like one of those
Medusas or Hades machines) But at $3500 for what is equivalent to a slower
Pentium at best, I just can't afford it. :(

And visa-versa. I run Win95 and Linux, and find them both to have their
pros and cons, but if I had to choose one, I would choose Win95.

Now, some Amiga-centric person is probably out there saying, "Gee, these
PC losers need multiple OSes to get what an Amiga owner has in one OS",
and to that person I say, "I would choose either one of them over
AmigaDOS". I have all three, and my computing time is about 60% Win95,
35% Linux (intel), and 5% AmigaDOS. OS/2 was down to 0%, so I deleted
the partition.

Why wouldn't you browse the web just as fast? The modem would be the
limiting factor.

> it
> prints just as fast on the same printer.

Again this is a i/o bound task that wouldn't be significantly affected by
the processor. Unless you are using a printer that depends on the CPU for
rendering.

degradation?1

That only means that all of your background tasks are being starved for CPU
time.

I guess, then, that not many of them have written video drivers :)

> To them, the concept of installing a driver of any kind, in any
> way is completely alien. They rail upon this as a Win failing.
>

This probably stems from the fact that one part of the spec of NuBus and PCI is a method of providing video drivers in a card ROM. Video cards are not required to do this, but, if they do, the user does not have to install a driver.

Another factor is that Mac users typically do not need to select the driver to use with most types of cards. Usually, the most that is needed is to run an installer script on a flopppy. The OS and sometimes the driver will determine if the driver's hardware is present. If it is, the driver is loaded. If it isn't, the driver is not loaded. Thus, you could, theoretically, have hundreds of video drivers installed on your system, plug in a video card that requires one of those drivers, and the correct driver will load and run the video card; the user will not have to select which driver to load for the card.

> Without a driver api, 3rd party drivers become somewhat difficult.
>

True. I'm glad we provide driver api's for many device classes.

> Can you expect MacOS plug & play to work when a 3rd
> party driver is required? Will it work if the low

level hardware
> spec is not adhered to?
>

There are a few levels to plug-n-play. The first is being able to write a driver and have it or the OS be able to tell if the hardware for the driver is available and automatically load the driver and correctly configure and operate the device. The only requirement for the user is to run some installer script on a floppy -- no setting IRQ's, com ports, SCSI ID's, etc. The second level of plug-n-play is all of the above with the driver being loaded from the hardware device itself. In this case, all the user has to do is plug in the hardware, and the driver software is automatically installed. This level of plug-n-play is possible with NuBus, PCI, most hard drives (read off the media), FireWire (we're working on Open Firmware specs for FireWire), and others.

As far as the low level hardware spec goes, a PCI video card should adhere to the PCI spec. If it does and has a video driver in card ROM or installed from a floppy, it will work. If it doesn't conform to the PCI spec, all bets are off.

This is not actually correct. Perhaps you meant to say "Mac video card
'drivers' are written to the Mac video 'driver' spec or they don't work."
That statement is correct for both the Mac and Windows.

Well, they are. But, just as with some applications, 3rd parties don't
neccessarily support the MacOS. It's merely a matter of software drivers,
not hardware.

>
> Macs don't need drivers for basic functionality. They can take advantage

> things that go beyond the Quickdraw spec.
>

As for video cards, Macs do need drivers for basic functionality and
graphics acceleration. On most video cards, however, a driver is provided
in the card ROM, so users don't need to install any drivers from a floppy.

>
> > >info required for anyone to write software or build hardware for the

> > >You'll be surprised how little the Mac video spec has changed over the
> > >years.
> >

As far as video hardware goes, it has changed quite a bit on our own systems. Apple doesn't mandate any video hardware spec other than providing a basic frame buffer. As far as the video driver spec, a lot of it has remained the same, but a lot has been added such as support for sleep, graphics acceleration, and hardware cursors.

> just as 'built in' as it is for MacOS.
>

From what I've heard, multi-monitor support in Windows 95 is dependent upon support in the driver and possibly the video card itself. If a 3rd party does not implement extra code in their driver, multi-monitors are not supported for those cards. I've heard that some Windows video drivers support multi-card multi-monitors if you have more than one of the same video card with each set to the same resolution and bit depth.

The difference on a Mac is that multi-monitor support is built in to QuickDraw; it is not a function of the video driver. Thus, on the Mac, you can install multiple video cards from different vendors, set them to different resolutions and bit-depths and have it all work. Windows can span across the various screens and will display correctly even if the displays have different bit-depths.

> >
> >Supporting the various Quickdraw functions is a lot more than just
> >supporting a dumb frame buffer.

Actually, Quickdraw assumes a dumb frame buffer unless a card has hardware acceleration and provides driver software to support the acceleration.

> I also suspect that this 'standard' is just another instance
> of VGA++. Everyone is essentially cloning the same hard-
> ware specification.

However, the dumb frame buffer hardware may be implemented in many
different ways. The only video card memory that Quickdraw directly
accesses is the frame buffer. Quickdraw makes driver calls to get the
frame buffer base address, resolution, bit-depth, row bytes and to set the
resolution, bit-depth, etc.

> is achieved is qualitatively and quantitatively different.

I've mentioned this on another thread, but this thread is getting more
attention so I'll clear things up here too. The MacOS only requires
conforming driver software, not hardware.

I know not the people of which you speak, but as a business man myself,
I would suggest that the answer to your query lies in the question.

They charge what the market will bear, and in so doing maintain the
viability of their endeavour. Or to turn it the other way round, the
ones you like because they charge less disappear because in keeping
you happy they are themselves unviable in the long term.

Brian-Roland Miller <brmiller@tiac.net> wrote:

>It certainly isn't superior in support or speed, but, as you

Actually TOS is superiour to NeXT OS in terms of speed. I think what you may have been referring to is hardware speed. In which case, TOS based machines can and do compare quite nicely.

The rest of this message is not aimed specifically at you Brian...

The combination of an efficient OS and efficient application programming make so called antique (by Peter's standards anyway) hardware like an 040 or 060 perform faster than MacOS and applications on the fastest PPC.

The fact that even Apple doesn't seem to know where it wants to go today,
only sets Apple up for more criticism by non Apple users as well as Apple users.

There is absolutely nothing wrong with a company that changes business plans part way through a year. In fact, this is a good sign, a company that is flexible and open minded and willing to change with the market is a healthy company.

However, a company that flip flops and changes it's mind several times during the year looks to be indecisive and gasping for air. This is exactly the problem with Apple today and the NeXT announcement only serves more fuel to the fire.

We can all comfort in knowing that MicroSoft will not let Apple die since that would leave MS in a risky situation with the Justice Dept. If Apple dies, MS might be forced to become smaller.

1997 will be a big year for personal computing. 1997 will an enormous amount of innovation in computing and .... believe it or not .... the post office!

I wish everyone a Happy and Prosperous New Year!

All the best,
Chris @ Computer Direct

From what I have read, parts of Copland will be grafted over Next Step. The remaining unix that the user sees will be eliminated. The end product will hopefully be a nice OS when its ships later in '97'. By that time a 300mhz PowerMac can be had for $2000 or less.

Also, now that the Be OS will not be adopted, I am sure there is an incentive for Be to finish the OS and get it out and let the market forces decide.

Very true that many will think that TOS will be superior in their minds. People should use whats best for them. My only beef when they start to exagerate and become deluded in regards to other platforms.

And what might that be? I would have not lost any sleep if Dole was elected. However, with a Repub Congress, thats just too much for my stomach. Amazing that no one talks about the Contract on America anymore. Lets hope that the sensible middle on both sides can work together..
